# Mean Seasonal Cycles and Interannual Variations at 0°, 110°W and 0°, 140°W during 1980–1991

M. J. McPhaden<sup>1</sup> and M.E. McCarty<sup>2</sup>

*Abstract.* This report summarizes current meter mooring data at 0°, 110°W and 0°, 140°W in terms of multi-year monthly mean time series and mean seasonal cycles. Data span the years 1980–1991 at 110°W and 1983–1991 at 140°W. The measurements consist of surface winds, air temperatures, ocean currents in the upper 250 m and ocean temperatures in the upper 500 m.

## 1. INTRODUCTION

Wind, air temperature, ocean temperature and current measurements have been made in the vicinity of 0°, 110°W and 0°, 140°W since the early 1980's from surface moorings deployed as part of NOAA's Equatorial Pacific Ocean Climate Studies (EPOCS) program and the Tropical Ocean-Global Atmosphere (TOGA) program. The 2 mooring sites are situated in the equatorial Pacific cold tongue where sea surface temperature (SST) anomalies associated with El Niño/Southern Oscillation (ENSO) events tend to be largest, and where ocean dynamics are crucial to the development of ENSO variability. Over 11 years of data are available at 110°W (1980–1991) making this the longest continuous moored time series in the world ocean (McPhaden, 1990). The shorter 140°W time series is over 8 years long.

The purpose of this report is to summarize the mooring data in terms of multi-year monthly mean time series and mean seasonal cycles. Mean seasonal cycle calculations using shorter versions of these time series have appeared previously in the literature (e.g. Halpern, 1987a; McPhaden and Hayes, 1990a; Latif *et al.*, 1990; McPhaden *et al.*, 1991). However, given the effort required to collect these data over the past decade, it is desirable to have a consistent analysis of the entire data set for the longest possible period. We expect that this analyzed data set will be useful for validating ocean general circulation models under development for short term climate prediction. These data should also be valuable as background climatological information for past and future field programs in the eastern equatorial Pacific. Finally, as part of the TOGA Observing Array (National Academy of Science, 1990), a program was begun in 1990 to measure and transmit in real-time moored velocity measurements along the Pacific equator using acoustic Doppler current profilers (McPhaden *et al.*, 1990b). It is therefore appropriate to summarize the long records of mechanical current meter data collected in the eastern equatorial Pacific at this point of technological transition in EPOCS and TOGA mooring programs.

## 2. INSTRUMENTATION AND DATA PROCESSING

The moored time series used in this study consist of current, temperature and wind data from nominal locations of 0°, 110°W and 0°, 140°W. Data from a mooring at 0°, 108°W were also used on occasion as described below. The moorings were taut-line surface moorings deployed in depths of about 3700 m at 108°W and 110°W, and 4300 m at 140°W. Mooring recoveries and deployments were made at roughly 6 month intervals. The lengths of the moored time series and the depths instrumented at 110°W and 140°W are shown in Figures A1 and B1 of the Appendices. The time series are gappy because of occasional instrument failures and because instrument depths changed with time due to changing program priorities.

Current velocity and temperature were measured with EG&G Vector Averaging Current Meters (VACMs) and Vector Measuring Current Meters (VMCMs) in the upper 250 m. Speed differences between VACM and VMCM measurements are generally  $<5\text{ cm s}^{-1}$  (Halpern, 1987b), so for the purposes of this study they can be considered interchangeable. In 1983, additional temperature measurements were introduced in the upper 300–500 m. These were made for the most part using SeaData temperature recorders, although at 140°W SeaBird SEACAT temperatures were used at 100 m depth in 1987–88. In addition, mini-Temperature Recorders (MTRs) designed and built by PMEL replaced the SeaData recorders at 0°, 140°W in early 1991. Instrumental accuracies for VACM, SEACAT, and MTR temperatures are 0.01°C, whereas accuracy for SeaData temperatures is 0.05°C. SST was measured 1 m below the surface using either a Yellow Springs Instrument (YSI) model 44032 temperature sensor (calibrated accuracy of 0.01°C) or a YSI model 44204 temperature sensor (calibrated accuracy of 0.05°C). Air temperature was measured at 3 m above mean sea level using a YSI model 42032 thermistor in a multi-plated, self-aspirated radiation shields.

Winds from the equatorial current meter mooring were sampled 4 m above the mean water line on the surface toroid with either a vector averaging wind recorder (VAWR) or an Argos meteorological platform (AMP). The VAWR is an inverted VACM equipped with a Climet cup model 011-2B three-cup anemometer and pivoted vane (Freitag *et al.*, 1989). The AMP, designed at PMEL to transmit data in real time, is equipped with an R.M. Young model 05103 propeller and vane. Predeployment and postdeployment calibrations for the VAWR and AMP indicate expected instrumental errors in wind speed of about 0.2 m s<sup>-1</sup>. Comparisons of the two wind systems in a field experiment near 0°, 140°W suggest that for our purposes the cup and vane and the propeller and vane systems can be considered interchangeable (Freitag *et al.*, 1989).

Data were recorded at 15-minute to 2-hour intervals depending on instrument, then processed to daily averages for subsequent analysis. Gaps of less than 5 days duration were then filled by linear interpolation. Further details on data processing procedures can be found in Freitag *et al.* (1987, 1991).

### 3. INTERANNUAL VARIATIONS AND MEAN SEASONAL CYCLES

Daily averaged temperature ( $T$ ), ocean current ( $\vec{u}$ ) and wind velocity ( $\vec{U}$ ) data were first block averaged into calendar month means for all months in which 15 days or more of data were available. For wind speed ( $|\vec{U}|$ ) and pseudostress ( $|\vec{U}|\vec{U}$ ), daily values were first computed before monthly averaging. Mean seasonal cycles were then calculated by averaging monthly values across different years. Ocean temperature and velocity mean seasonal cycles based on these monthly averages were noisy because in some cases record lengths at a particular depth were short (e.g. only 1 year at 20 m for 110°W). Moreover, energetic 20–30 day waves in meridional velocity (Halpern *et al.*, 1988) and 60–90 day waves in zonal velocity and temperature (McPhaden and Taft, 1988) were not completely filtered out of the records by block averaging. Hence, additional filtering and gridding to standard depths were required to yield smoother vertical profiles and time series of climatological monthly means. Filling of partial records by linear regression or linear interpolation was also done to minimize aliasing of interannual variability associated with El Niño and La Niña events into estimates of the mean seasonal cycle. Gridding, filling and filtering procedures were performed as follows.

#### 3.1. Gridding

We chose standard depths of 10 m, 25 m, 45 m, 80 m, 120 m, 160 m, 200 m and 250 m for ocean velocity. These depths, plus depths of 1 m (SST), 35 m, 60 m, 100 m, 140 m, 300 m and 500 m were chosen for temperature. Data prior to November 1983 at 110°W were adjusted to standard depths by linear interpolation or extrapolation. The greatest vertical distance over which data were interpolated was 20 m (100 m to 120 m for velocities) during this time period. The 15 m velocity records at 110°W for 1981–83 were extrapolated to 10 m depth using the 1983–1991 mean vertical shear profiles between 10 m and 25 m. Linear interpolation was used to adjust the temperature records at 40 m depth to either 35 m depth (1987–91 at 140°W) or 45 m depth (1987–89 at 110°W). Records at 3 m depth were linearly interpolated to 10 m depth at 140°W for velocity (November 1990–October 1991) and temperature (May–October 1991). Also at 140°W, temperature records from 350 m depth (October 1990–May 1991) and 400 m depth (October 1987–May 1988) were adjusted to 300 m and 500 m, respectively, using the mean vertical temperature gradient between 300 m and 500 m.

#### 3.2. Filling gaps

Some gaps in the monthly mean records at 110°W were filled by direct substitution of wind, air temperature, ocean temperature and current data from the backup mooring at 108°W. The 108°W measurements are a reasonable proxy for those at 110°W by virtue of the high coherences between the 2 sites (e.g. Halpern, 1987a). Table 1 lists the times, depths and variables for which substitutions were made. No more than 13 months of data were substituted

**Table 1.** Data substitutions from  $0^\circ$ ,  $108^\circ\text{W}$  time series into  $0^\circ$ ,  $110^\circ\text{W}$  records. Data at 15 m, 50 m and 100 m were later gridded to the nearest standard depths in the climatologies.

VARIABLE	DATES
	Day/Mon/Yr
Winds	16/04/82–26/10/82
Air Temperature	16/04/82–26/10/82
Ocean Temperature	
SST	16/04/82–22/10/82 29/11/84–09/05/85 27/02/87–10/03/87 07/04/87–25/04/87
15 m	16/04/82–26/10/82
50 m	16/04/82–22/10/82
80 m	16/10/84–09/05/85
100 m	16/04/82–26/10/82
Currents	
15 m	16/04/82–26/10/82
25 m	24/03/87–25/04/87
50 m	16/04/82–26/10/82
80 m	16/10/84–09/05/85 02/07/86–06/11/86
100 m	16/04/82–26/10/82

at any given depth from the 108°W mooring, with the maximum number of substitutions occurring for SST.

Some data gaps in monthly mean zonal velocity and temperature records were filled by a combination of linear extrapolation and/or interpolation in depth. We used formulae of the form  $\hat{Y} = aX_1 + bX_2 + c$ , where  $\hat{Y}$  is an estimate of the variable  $Y$ , and where time series  $X_1$  and  $X_2$  bracket the series  $Y$  in depth. In the case of extrapolation,  $b$  was set to zero and the coefficients  $a$  and  $c$  were determined by linear least squares orthogonal regression. For linear interpolation,  $c$  was set to zero and the coefficients  $a$  and  $b$  were weighted by vertical distance from  $Y$ . In some instances, we used multiple linear regression to compute the coefficients  $a$ ,  $b$  and  $c$ . Extrapolation was required for 10 m zonal velocity and SST. Otherwise, different methods of filling were compared and the best estimator was selected for a given depth and variable.

To fill a gap by vertical interpolation or extrapolation, we required that the crosscorrelation of estimated monthly data ( $\hat{Y}$ ) with actual monthly data ( $Y$ ) be  $\geq 0.9$ ; we also required that there be no temperature inversions created by regression fills. Expected errors ( $\epsilon$ ) in the estimates  $\hat{Y}$  were determined by computing the root-mean-square (rms) deviations from measured monthly means, i.e.  $\epsilon = \text{rms } (\hat{Y} - Y)$ . These errors were roughly 0.2°–0.4°C for temperature in the upper 10 m at 110°W; 0.1°C–0.2°C for temperature in the upper 45 m at 140°W; 0.3°–0.5°C for temperature in the upper thermocline (60 m to 160 m at 140°W; 25 m to 120 m at 110°W), and 0.1°–0.2°C in the weak temperature gradient region below the upper thermocline. At both locations, the expected analysis error in vertically interpolated/extrapolated zonal velocities was 10–15 cm s<sup>-1</sup> in and above the Undercurrent core, and 5–10 cm s<sup>-1</sup> below the Undercurrent core.

For the data set as a whole, less than 20% of the monthly ocean temperature and zonal velocity estimates were filled by vertical interpolation or extrapolation, though at some depths the percentage rose to approximately 50% (Table 2). Monthly mean meridional velocities were not as highly correlated vertically as temperature or zonal velocity, so no meridional velocity gaps were filled using data from neighboring depths. We made no attempt to interpolate in time across record gaps in any of the monthly time series.

### 3.3. Filtering

The resulting gridded and filled monthly mean time series were smoothed with a 1-2-1 filter in time to eliminate the residual effects of intraseasonal fluctuations in the records. An identical filter was applied to the monthly mean wind vector components, wind speed, wind pseudostress and air temperature data. These smoothed time series were then averaged for each month for different years to produce estimates of the mean seasonal cycle. Computations including data from the 1982–83 ENSO lead to large biases (particularly in thermocline temperatures) as one would expect by including a “100-year” event in a decade long climatology.

Table 2a. Summary of monthly mean estimates for zonal velocity and temperature at 0°, 110°W. "Months of Data" refers to monthly means based on a combination of direct measurements at standard depths, measurements gridded to those depths according to procedures discussed in Section 3.1, plus direct substitutions of data from 108°W. "Percent Filled" refers to the number of monthly estimates derived by vertical interpolation or extrapolation from neighboring depths as discussed in Section 3.2.

Depth (m)	Number of Monthly Estimates	Months of Data	% Filled
<i>Zonal Velocity</i>			
10	139	123	12

Hence data from July 1982–June 1983 were excluded from the mean seasonal calculations for 110°W. For consistency, data from April–June 1983 were excluded at 140°W. We also excluded the 35 m temperature time series from the 110°W mean seasonal calculation. This record contained only 29 months of data, and was much shorter than time series immediately above and below.

Finally, we found that smoother vertical profiles of zonal velocity at 140°W resulted if we did not include the monthly values for July–October 1983 at 160 m and 250 m. The records at these depths were relatively short, and means were biased towards zero by weak eastward or westward flow during the 1983 La Niña. No similar bias due to interannual variability occurred in the equally short 200 m record begun in 1987 at the termination of the 160 m and 250 m time series, so that straight record length averages at these 3 depths lead to unrealistic positive curvature in July–October vertical profiles of zonal velocity between 160–250 m.

For temperature and zonal velocity, the resulting mean seasonal cycles (time series and vertical profiles) were much smoother and more realistic compared to similar analyses based on ungridded, unfilled, unfiltered monthly mean data. However, meridional velocities were still somewhat noisy because of the relative weakness of the mean seasonal cycle, the weaker vertical correlations and the smaller number of available monthly estimates. Details of the meridional velocity profiles and time series should therefore be interpreted with caution unless they are supported by a large amount of data (e.g. at 25 m, 80 m, 120 m at 140°W; and in the upper 120 m at 110°W).

## 4. DATA PRESENTATION

### 4.1 Plots

Data are presented in Appendix A for 110°W and Appendix B for 140°W. Figures A2–A4 and B2–B4 show the gridded, interpolated and smoothed time series of individual monthly mean ocean temperature and velocity. Dashed lines in these figures indicate values that have been interpolated from adjacent depths. Figures A5 and B5 show corresponding time series plots for wind velocities, wind speeds, wind pseudostresses, and air temperatures. Mean seasonal temperature and velocity time series at each depth are plotted in Figure A6–A8 and B6–B8 using cubic spline interpolation between data points; corresponding mean seasonal time series for wind velocities, wind speeds, wind pseudostresses, and air temperatures are shown in Figures A9 and B9. Estimated standard errors for each monthly mean are superimposed on these time series, assuming that monthly values from different years are independent Gaussian-distributed random variables. The standard error is defined as  $\sigma/N^{1/2}$ , where  $\sigma$  is the estimated standard deviation and  $N$  is the number of samples. Standard errors are estimated only when  $N > 3$ . Both  $\sigma$  and  $N$  are listed in Tables A5–A8 and B5–B8. The monthly mean time series are contoured in Figures A10 and B10. Figures A11 and B11 show climatological monthly mean vertical profiles using cubic

spline interpolation between data points indicated on the right axes. Figures A12 and B12 show the corresponding annual averages and standard deviations of the 12 monthly means.

#### 4.2. Tables

The individual monthly means are tabulated in Tables A1–A4 and B1–B4. Interpolated values are underlined and a data void is indicated by –999.99. The monthly mean climatologies are tabulated in Tables A5–A8 and B5–B8. These tables list monthly means, standard deviations, minima, maxima, skew, number of monthly samples on which the statistics are based (N), and (for zonal velocity and ocean temperature) the number estimates (M) at a particular level before filling by vertical interpolation or extrapolation. In the case of 110°W, the parameter M includes data substituted from 108°W. Standard deviation in these tables is defined as

$$\sigma = \left[ \frac{1}{N-1} \sum_{n=1}^N (X_n - \bar{X})^2 \right]^{1/2}$$

where X is the variable in question and  $\bar{X}$  is its sample mean. Skew, which provides a measure of the symmetry of the probability distribution, is defined as

$$\gamma = \frac{1}{N\sigma^3} \sum_{n=1}^N (X_n - \bar{X})^3$$

Similar statistical summaries for annual means are presented in Tables A9–A10 and B9–B10, in which N = 12 indicates that the statistics are based on the 12 monthly values from the mean seasonal cycle. NTOT in Tables A9–A10 and B9–B10 refers to the total number of months of independent data that go into the calculation at each depth; it differs slightly from the months of data listed in Table 2 for zonal velocity and temperature because data from the 1982–83 ENSO were excluded from the climatologies.

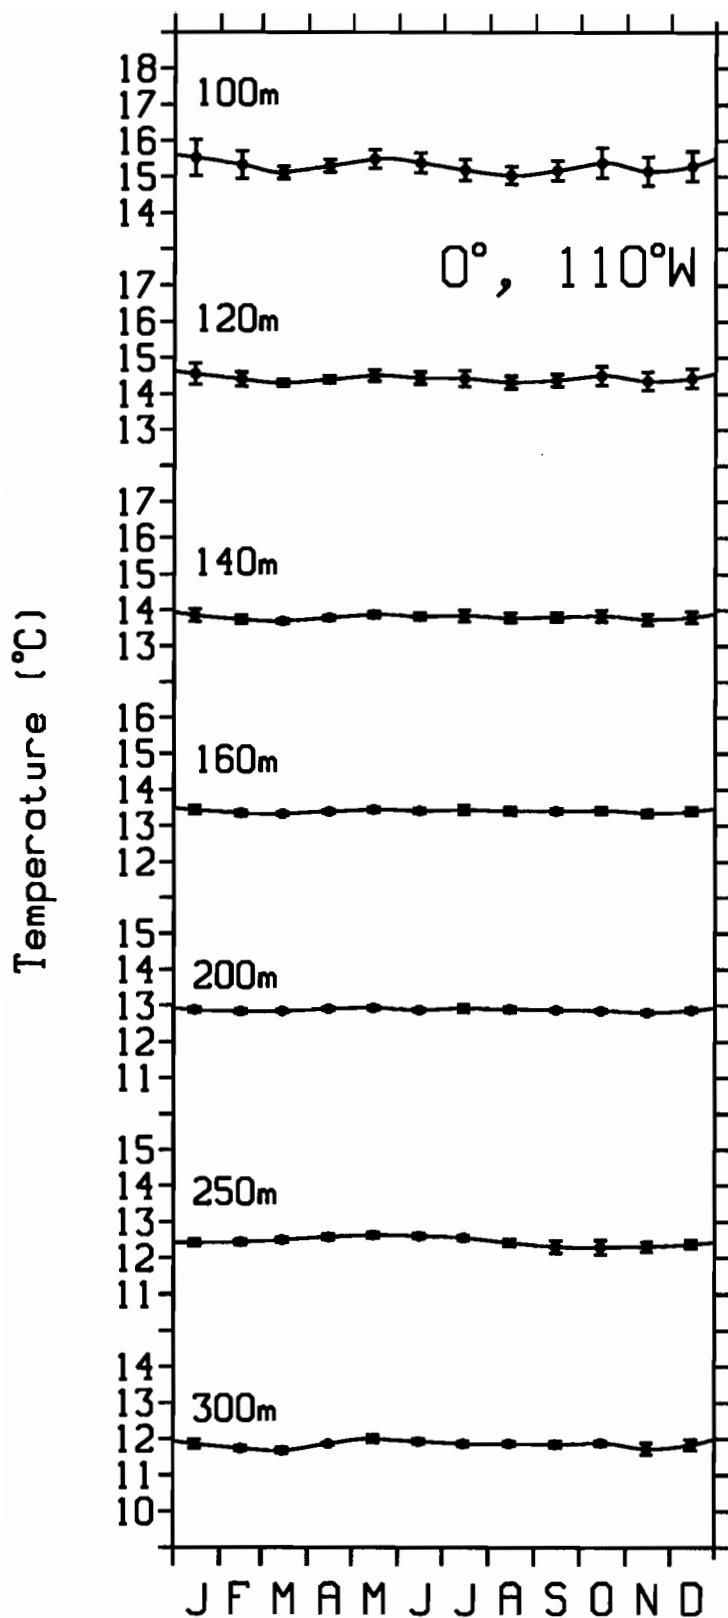

Figure A6. Continued.

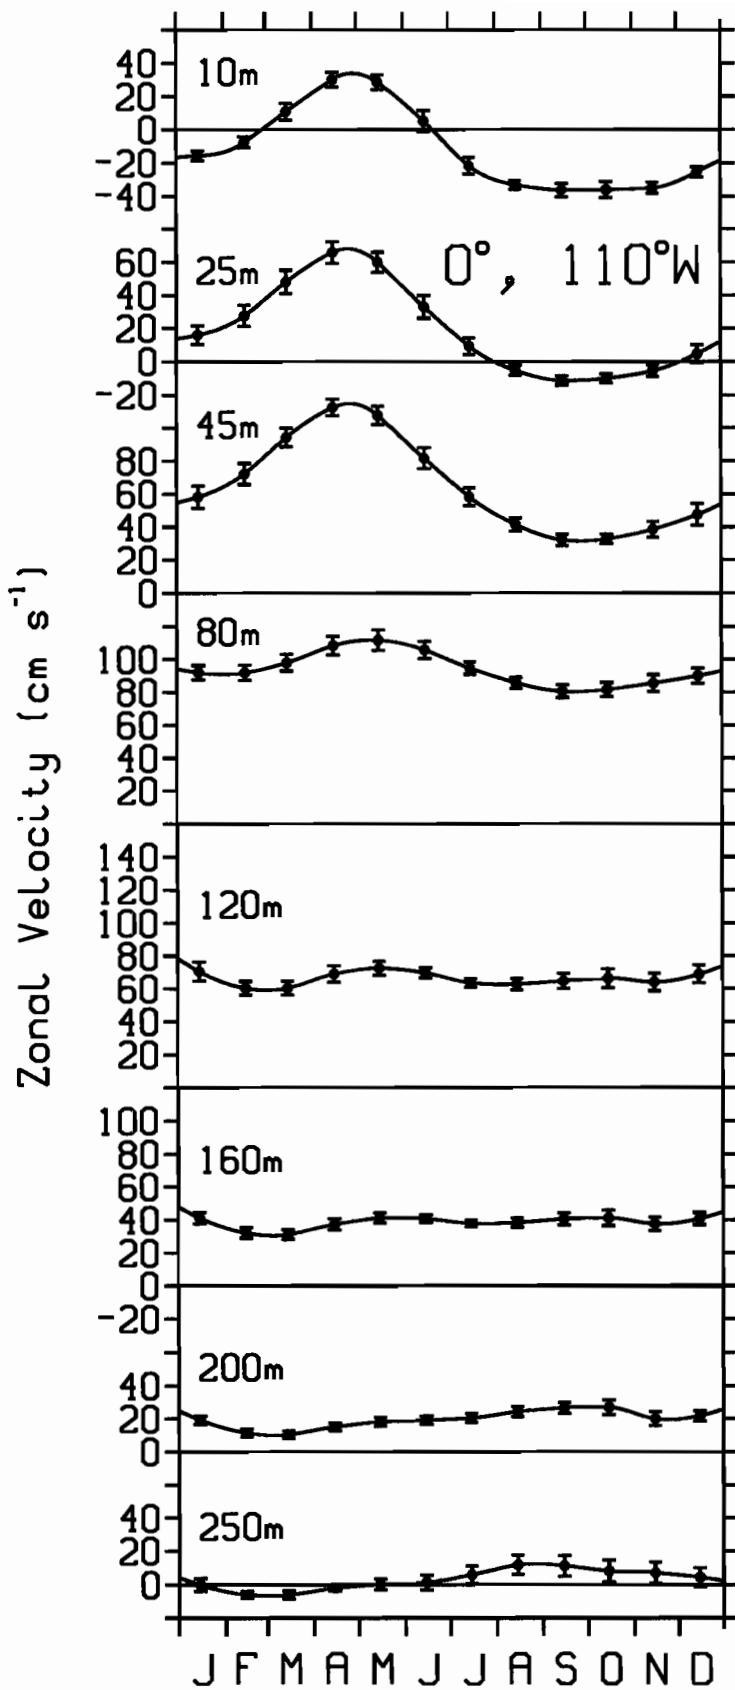

Figure A7. Time series of climatological monthly mean zonal velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ$ ,  $110^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

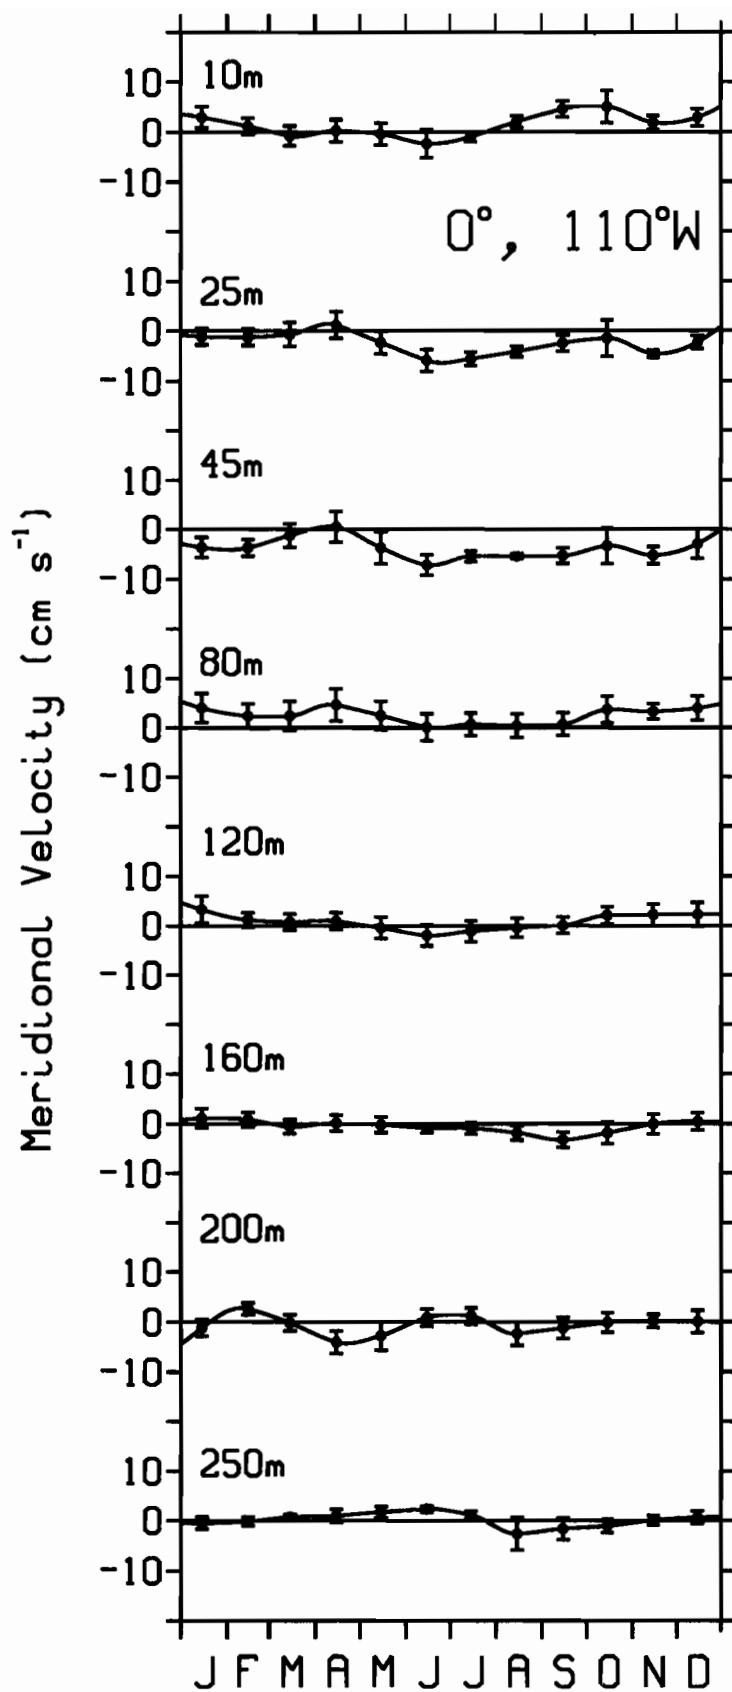

Figure A8. Time series of climatological monthly mean meridional velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ$ ,  $110^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

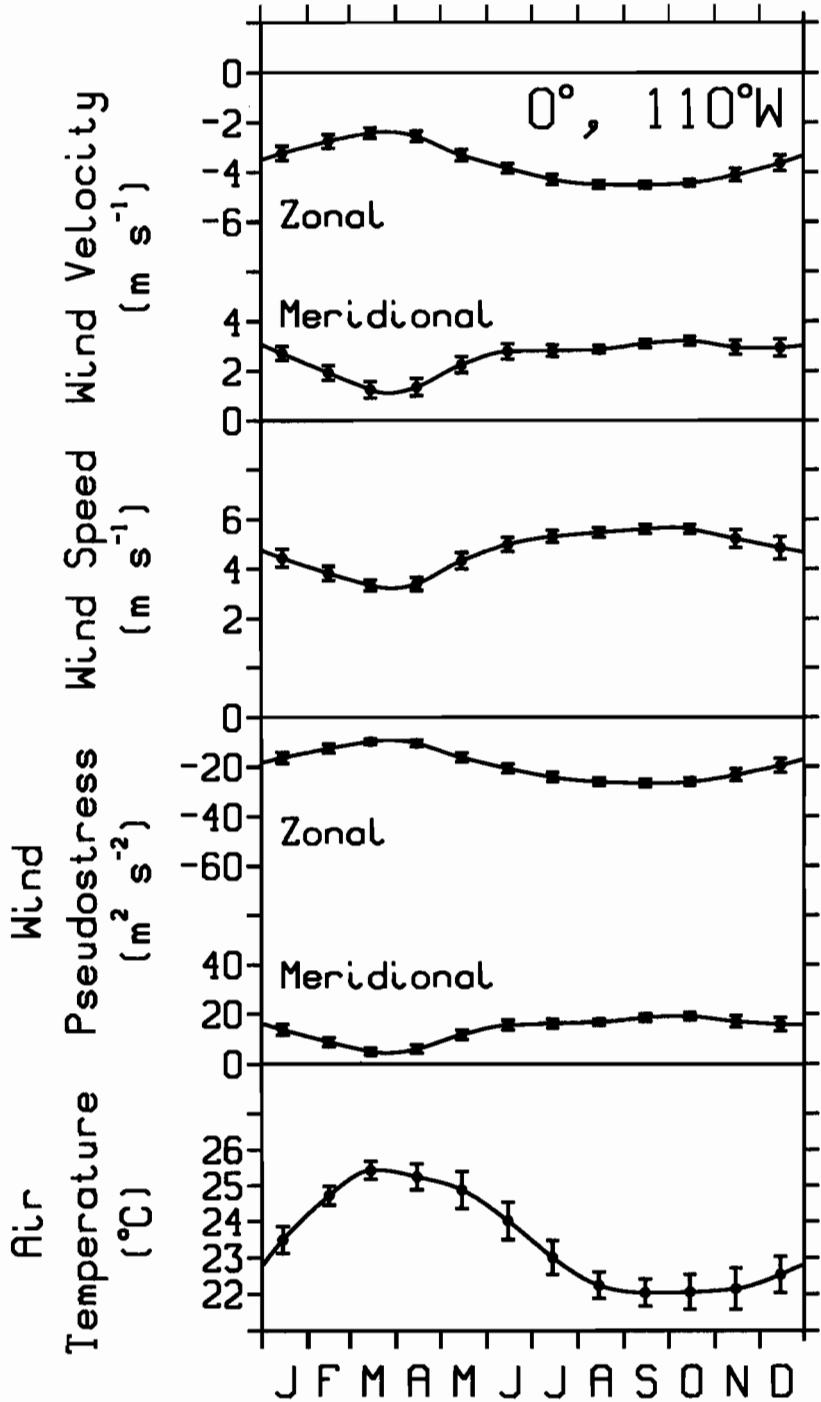

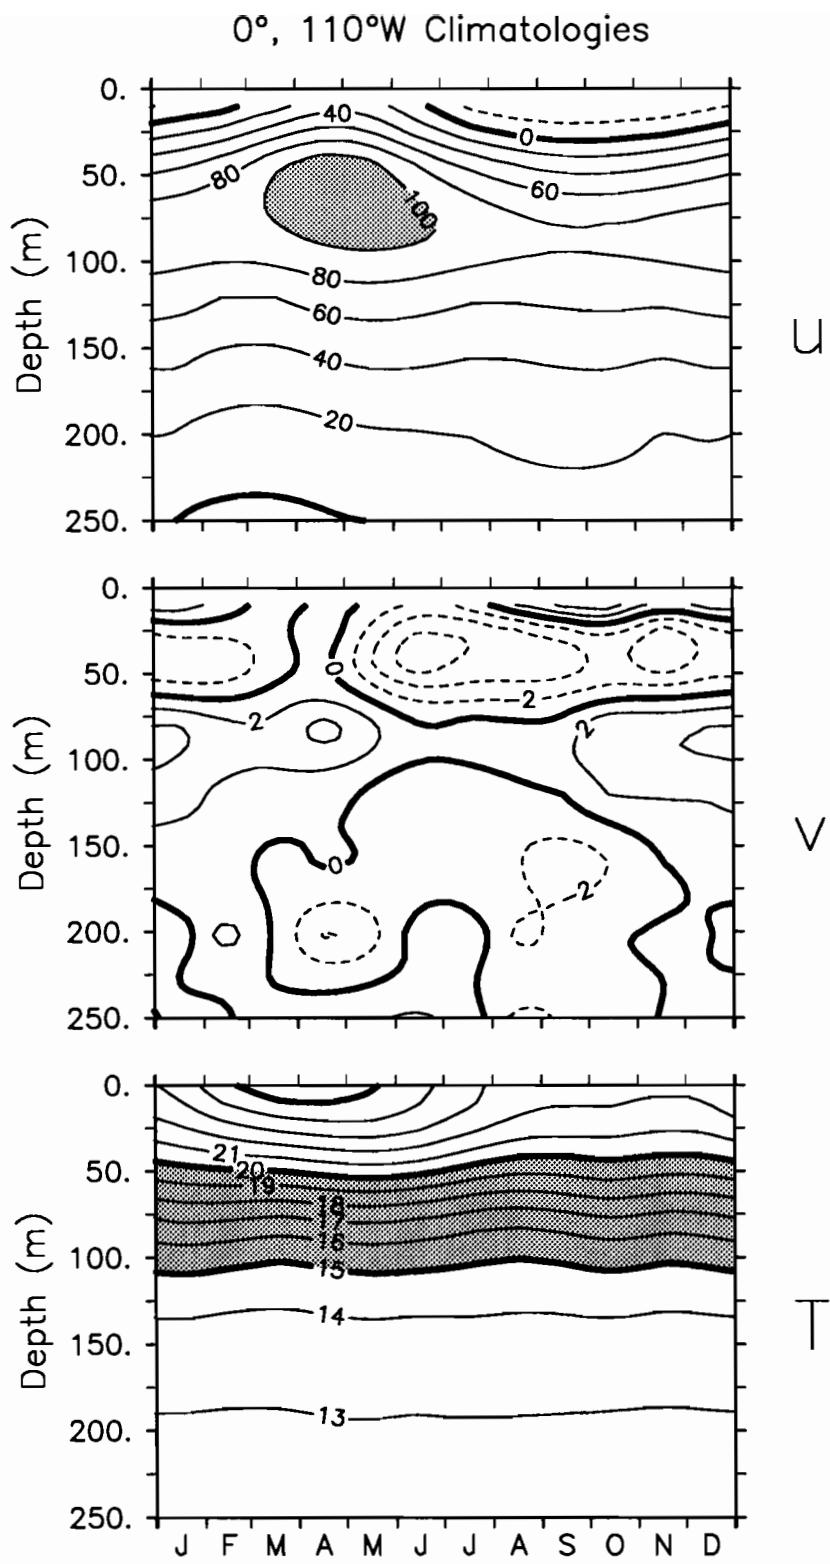

Figure A9. Time series of climatological monthly mean winds and air temperatures at  $0^\circ, 110^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

**Figure A10.** Contoured time series of zonal velocity (u), meridional velocity (v) and temperature (T) at 0°, 110°W. Velocities are in  $\text{cm s}^{-1}$  and temperature is in °C. Dashed contours are for westward or southward flow. Shading highlights zonal velocities > 100  $\text{cm s}^{-1}$ , and temperatures between 15°–20°C.

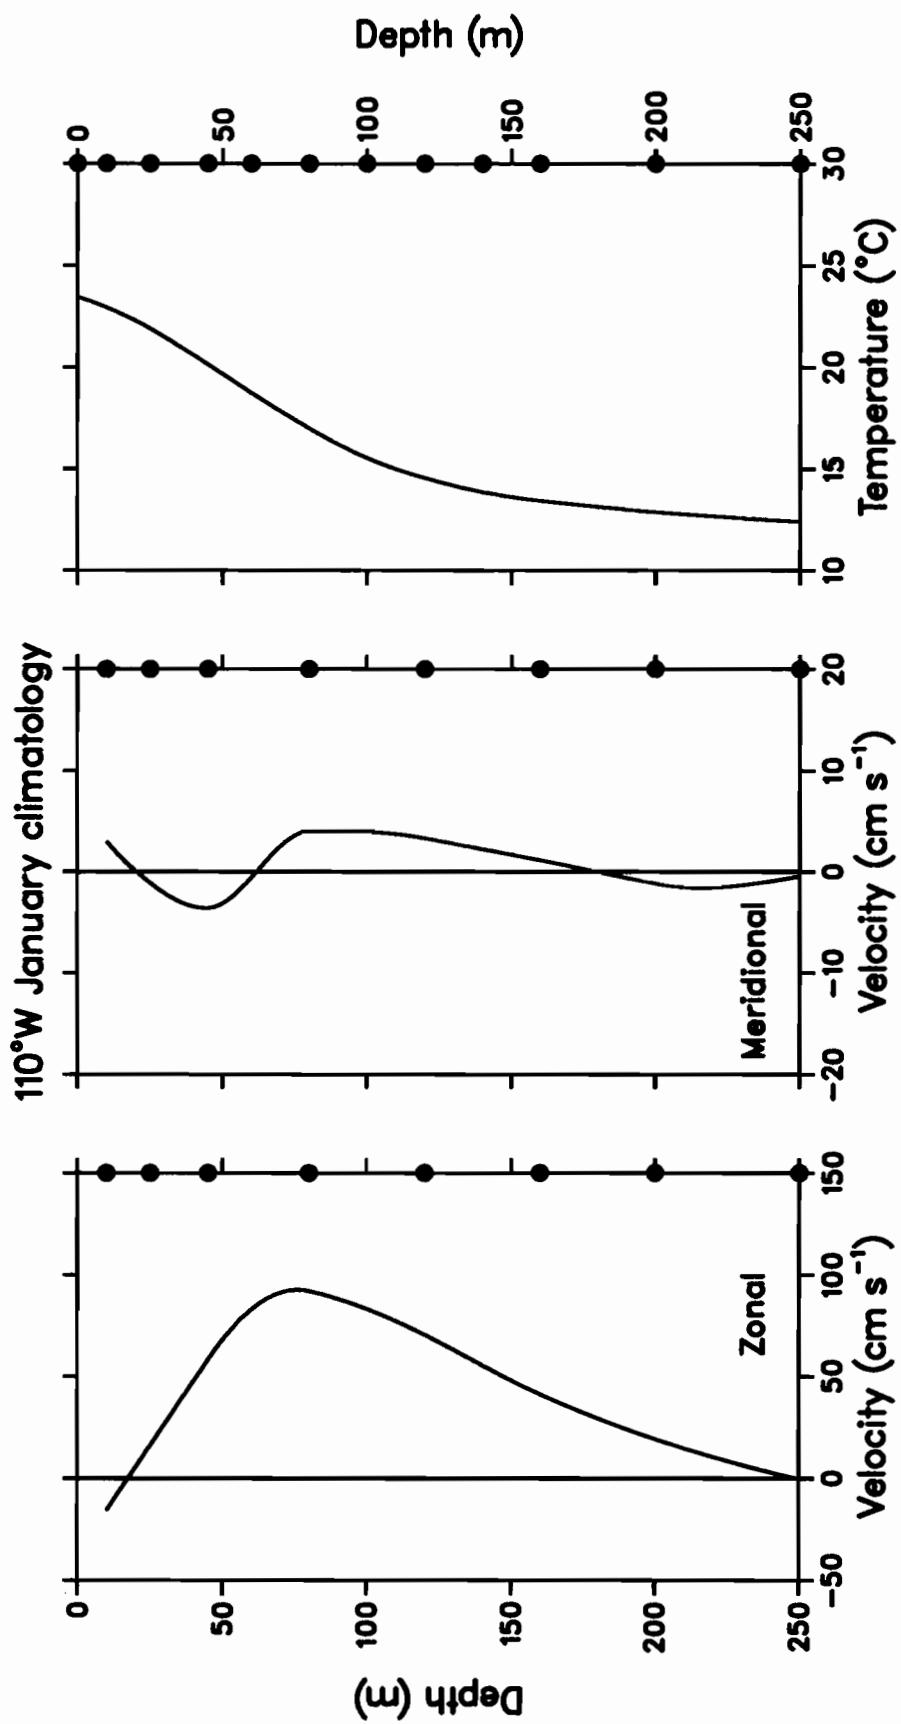

Figure A11. Climatological monthly mean profiles of zonal velocity, meridional velocity and temperature at  $0^{\circ}$ ,  $110^{\circ}\text{W}$ . Solid circles on the left axes indicate standard depths on which the profiles are based.

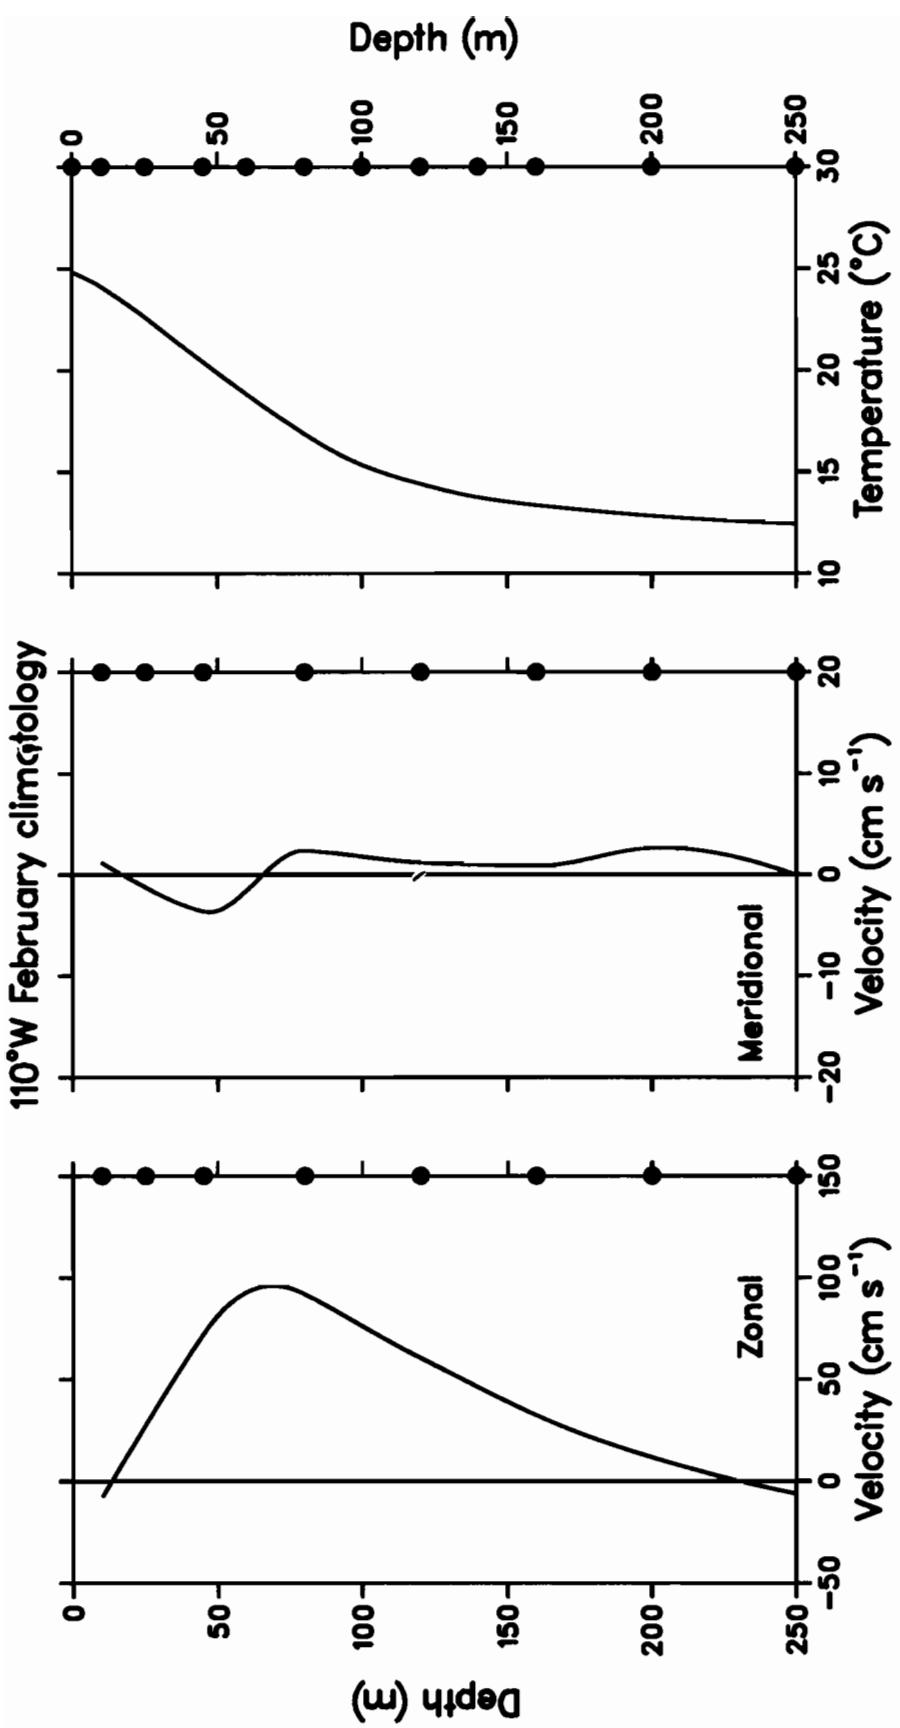

Figure A11. Continued.

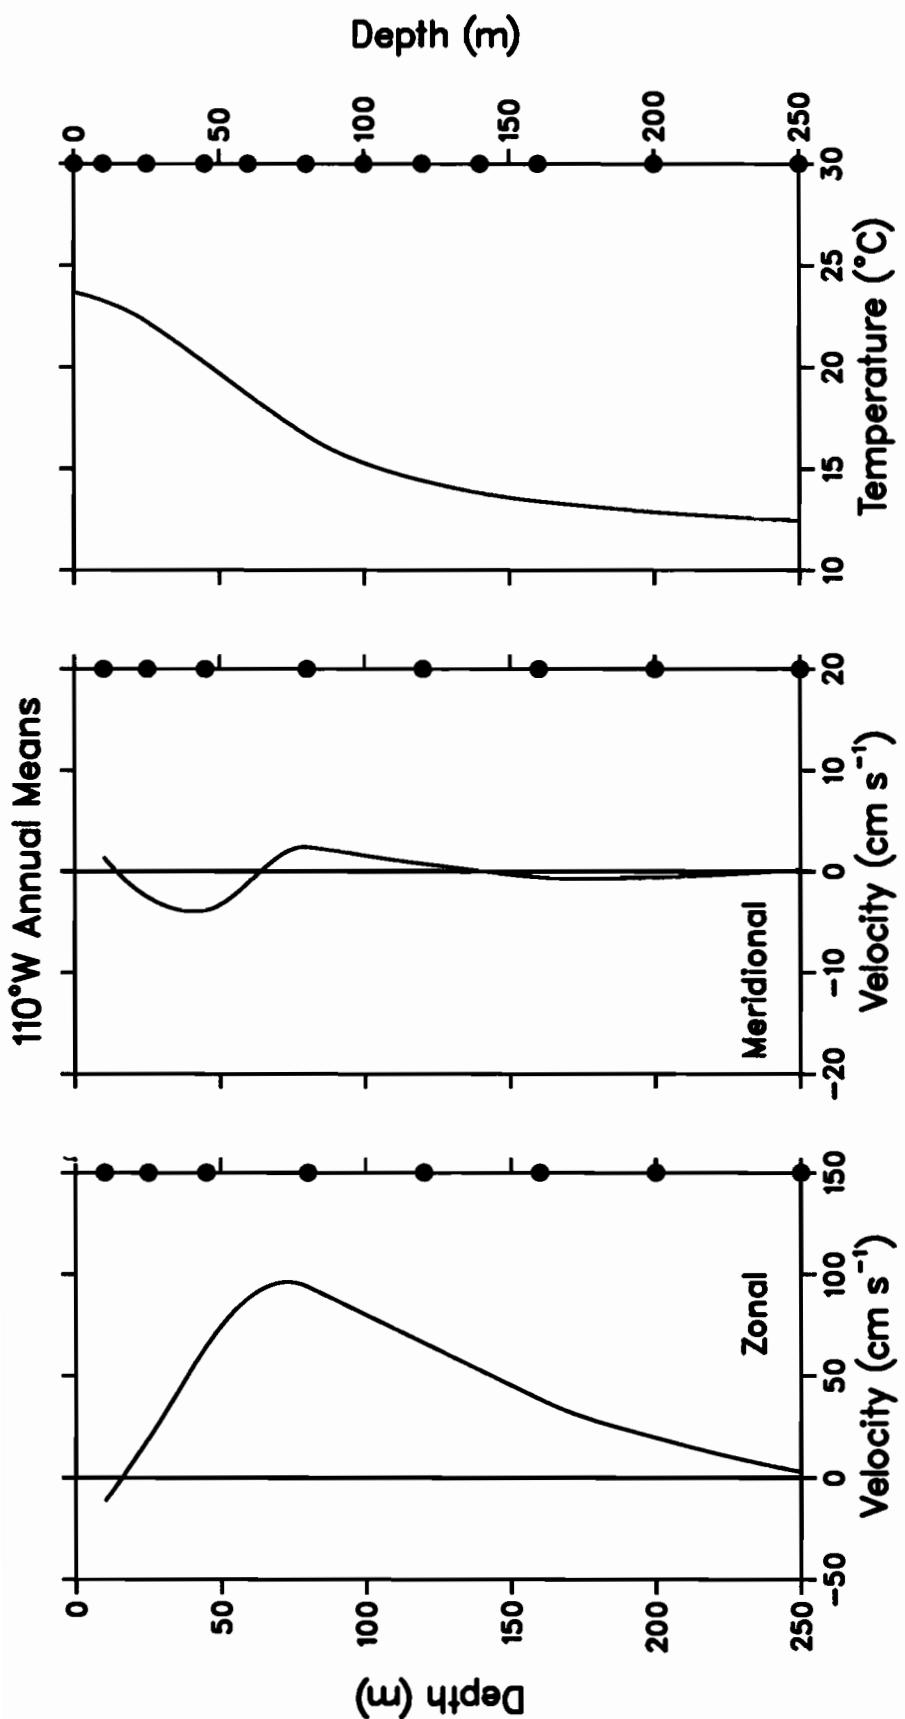

Figure A12a. Profiles of annual mean zonal velocity, meridional velocity and temperature at  $0^{\circ}$ ,  $110^{\circ}\text{W}$ . Solid circles on the left axes indicate standard depths on which the profiles are based.

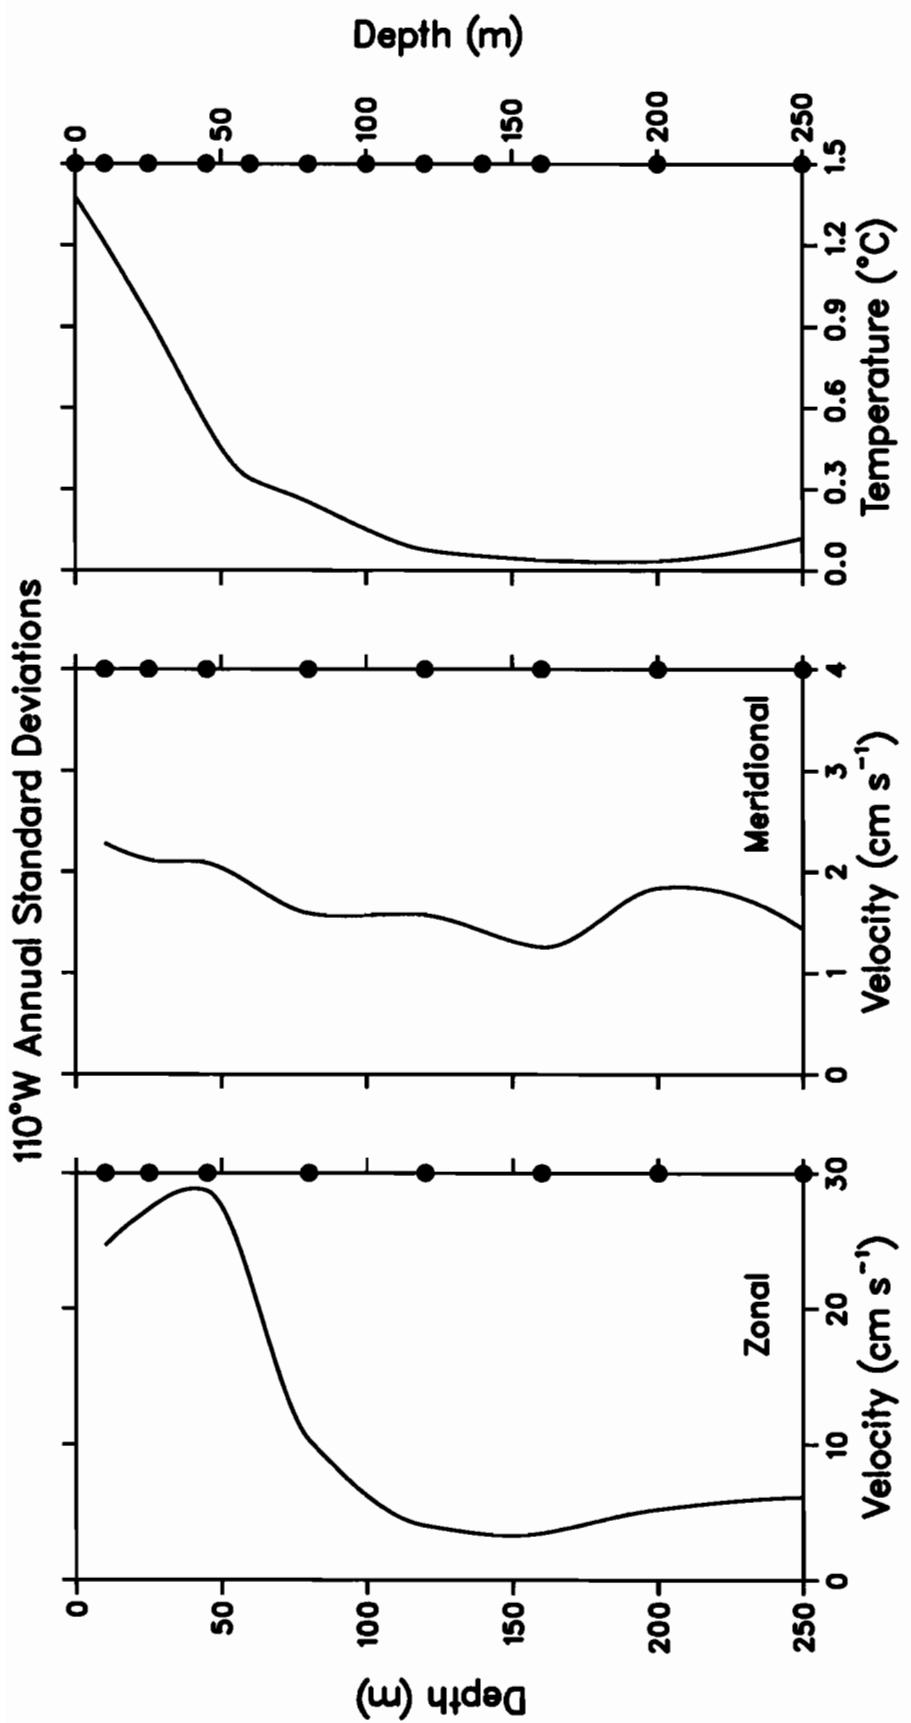

Figure A12b. Profiles of annual standard deviations for zonal velocity, meridional velocity and temperature at 0°, 110°W. Solid circles on the left axes indicate standard depths on which the profiles are based.

**Table A1.** Monthly averaged temperatures (in °C) at 0°, 110°W for 1980–1991. Filled data are underlined and missing data are indicated by –999.99.

**APPENDIX B**

**0°, 140°W Figures and Tables**

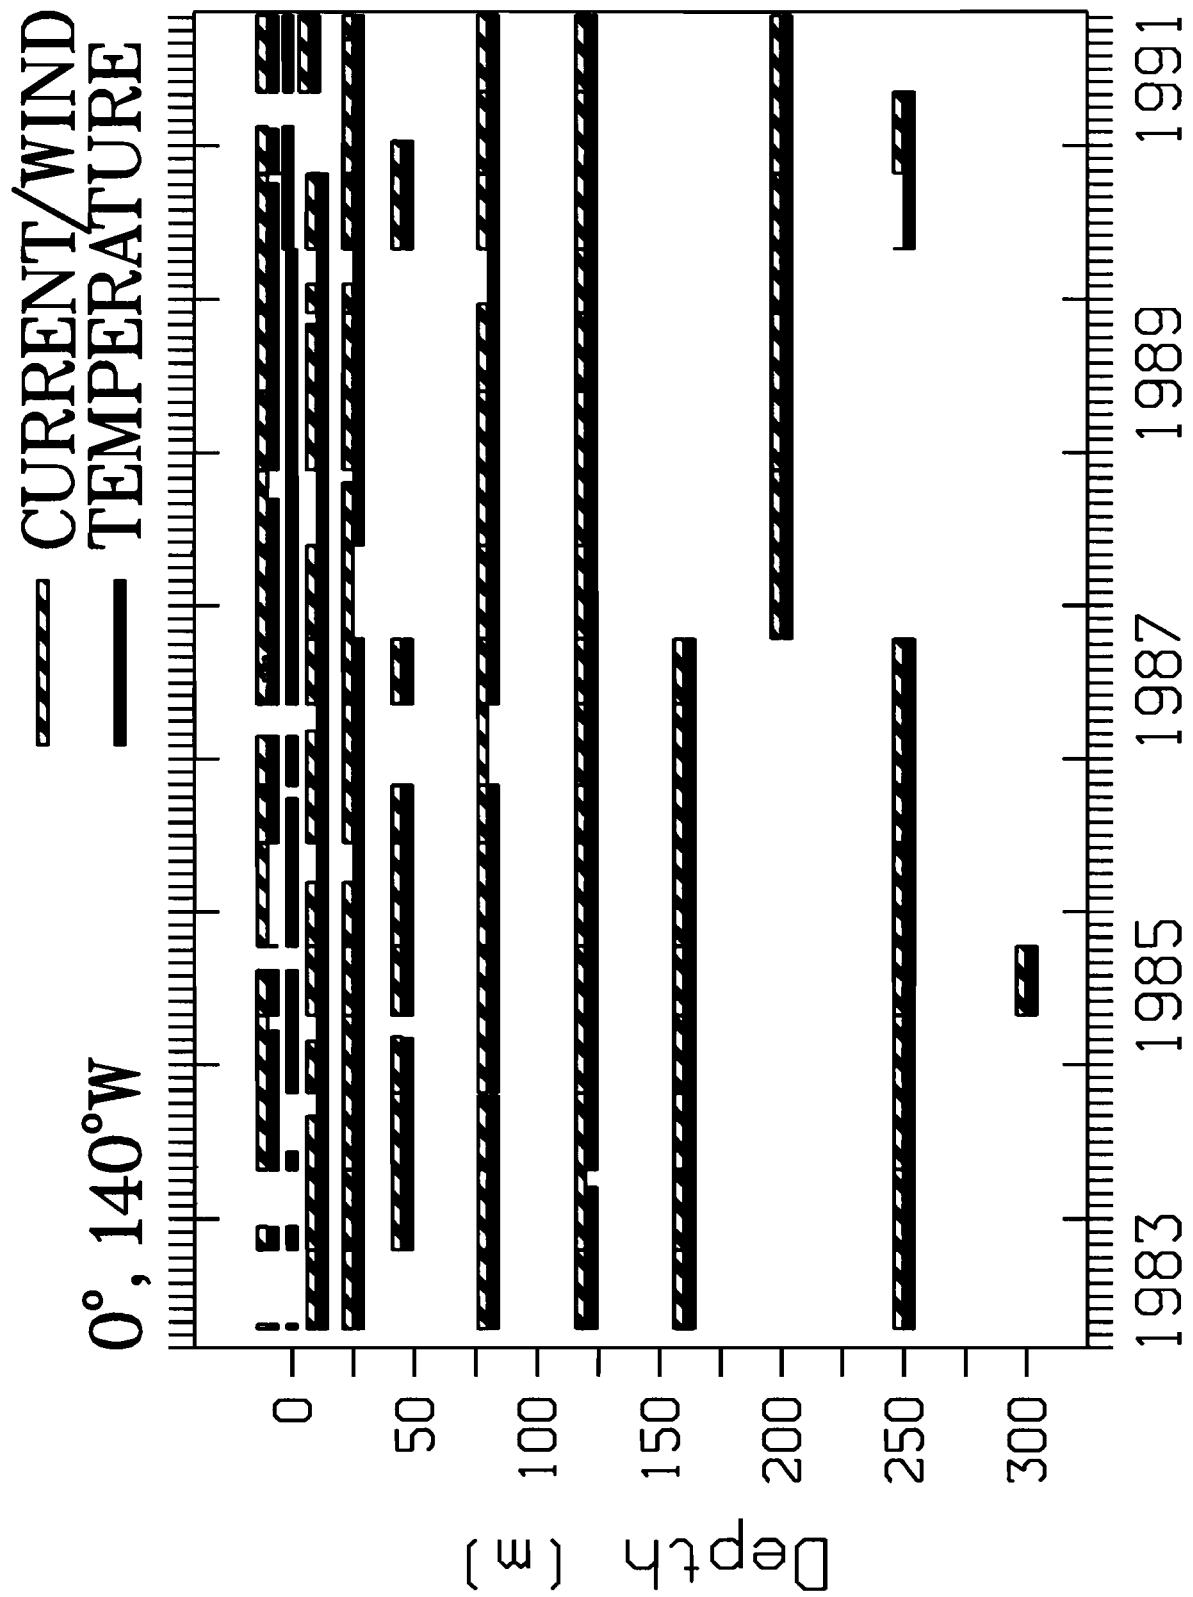

Figure B1a. Bar chart showing velocity and temperature data availability from current meters and from wind recorders as a function of depth at 0°, 140°W.

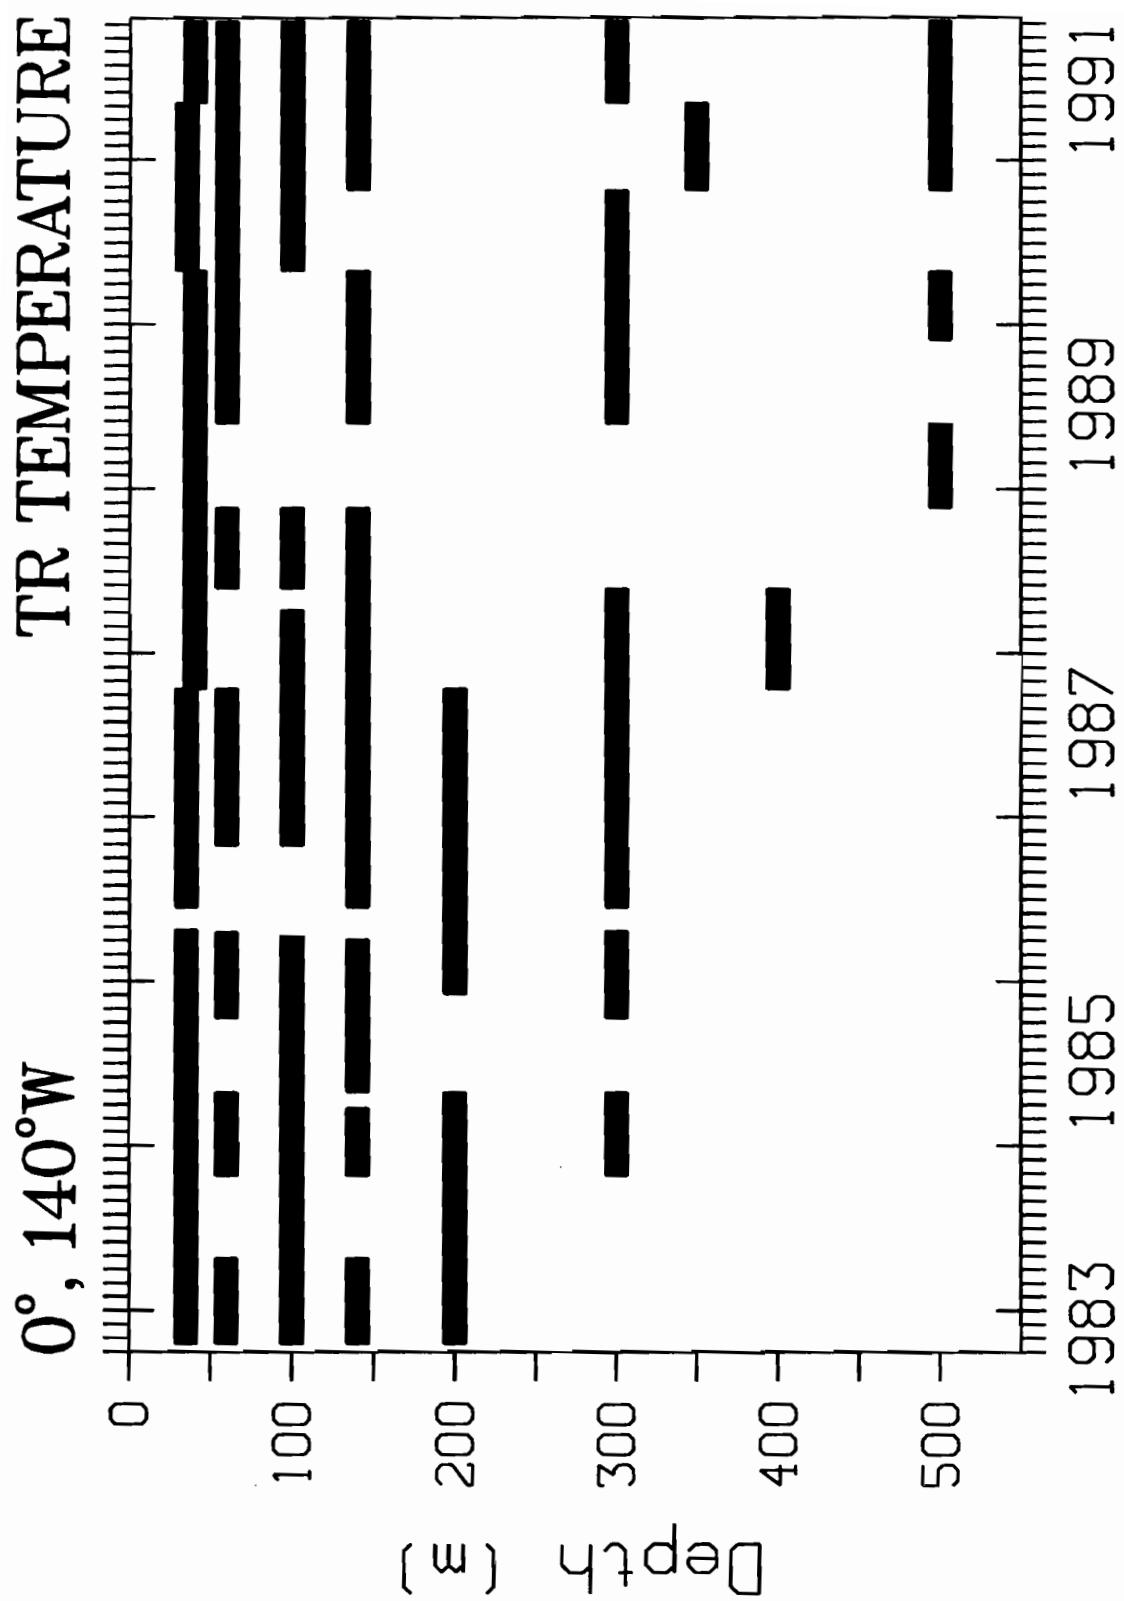

Figure B1b. Bar chart showing availability of data from temperature recorders (TRs) at  $0^{\circ}, 140^{\circ}\text{W}$ .

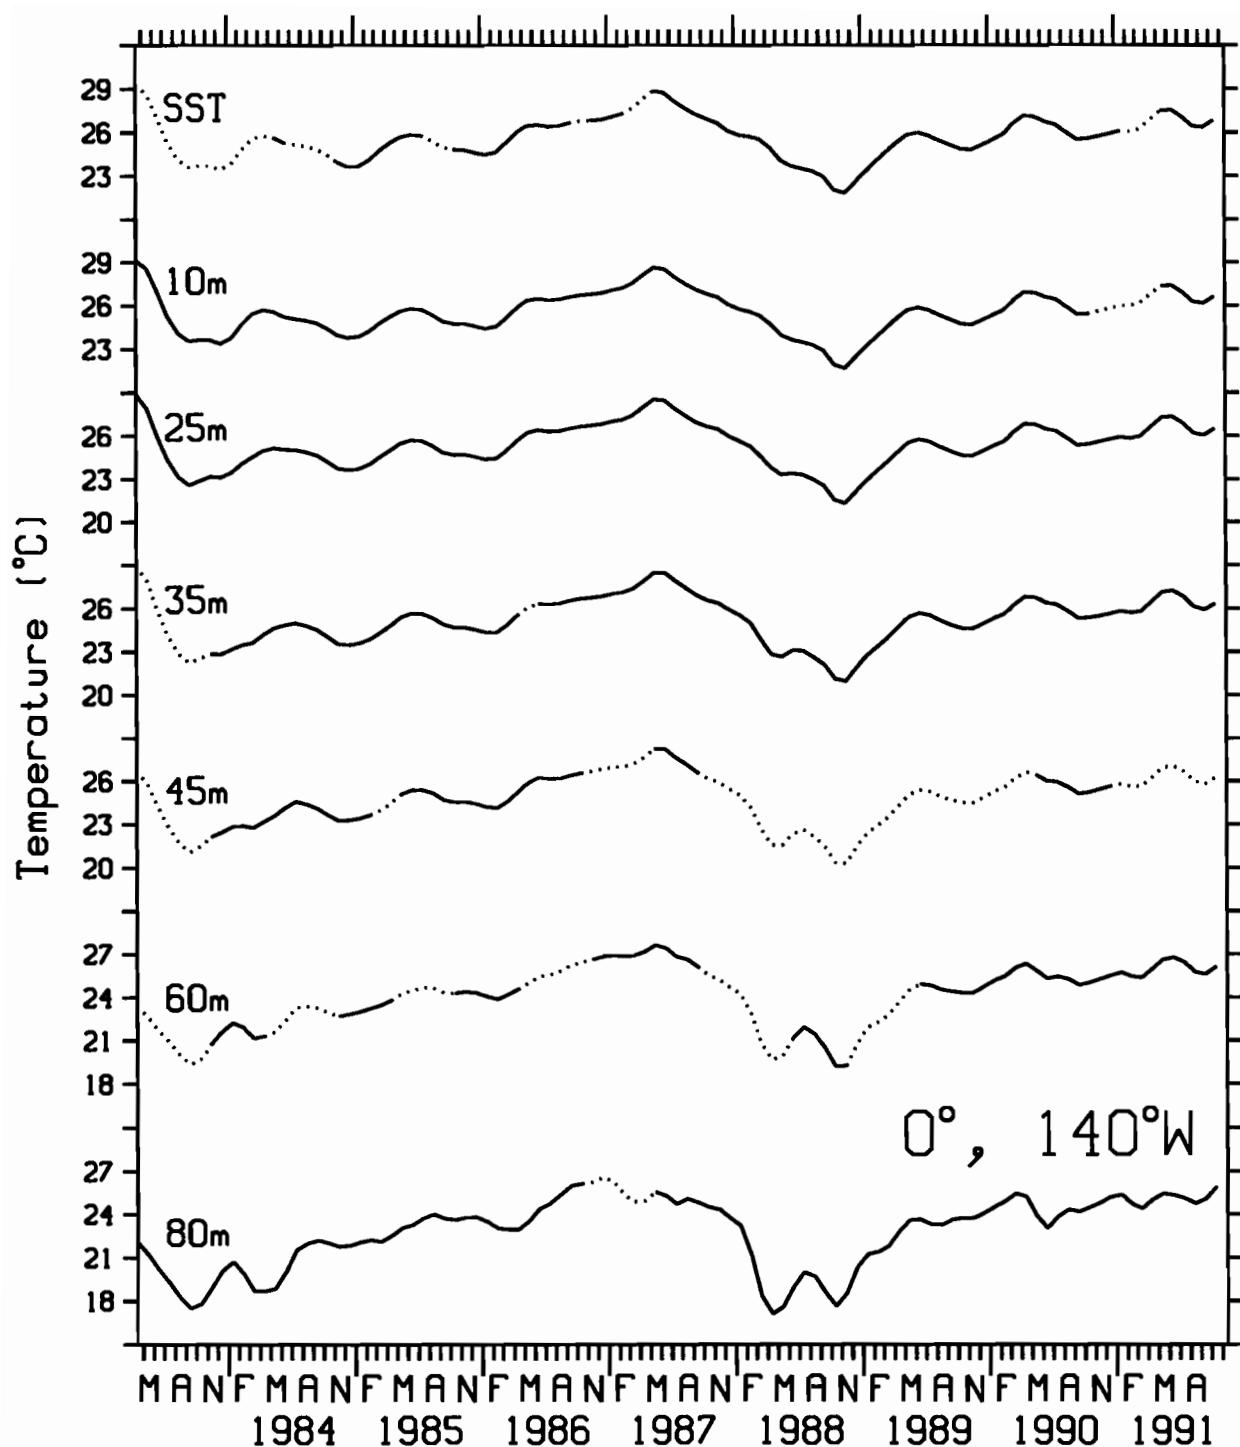

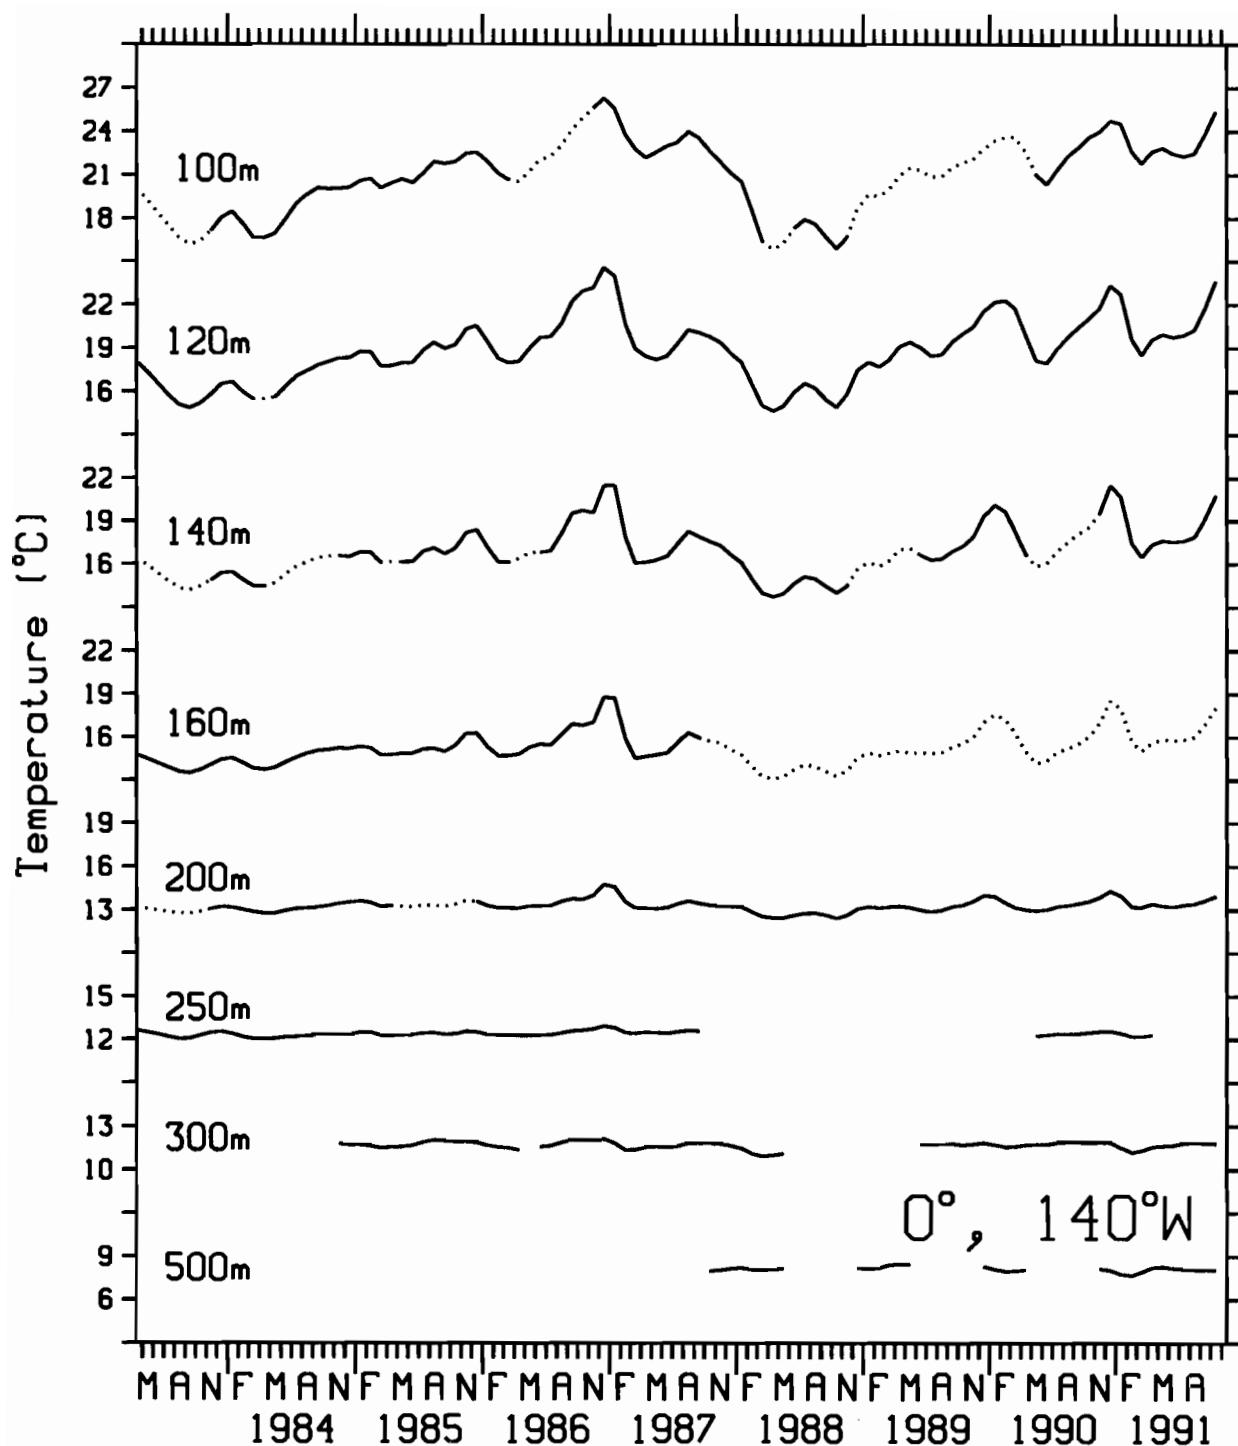

Figure B2. Time series of monthly mean temperatures (in  $^{\circ}\text{C}$ ) at  $0^\circ$ ,  $140^\circ\text{W}$ . Dotted lines indicate data that have been filled by vertical interpolation or extrapolation.

**Figure B2.** Continued.

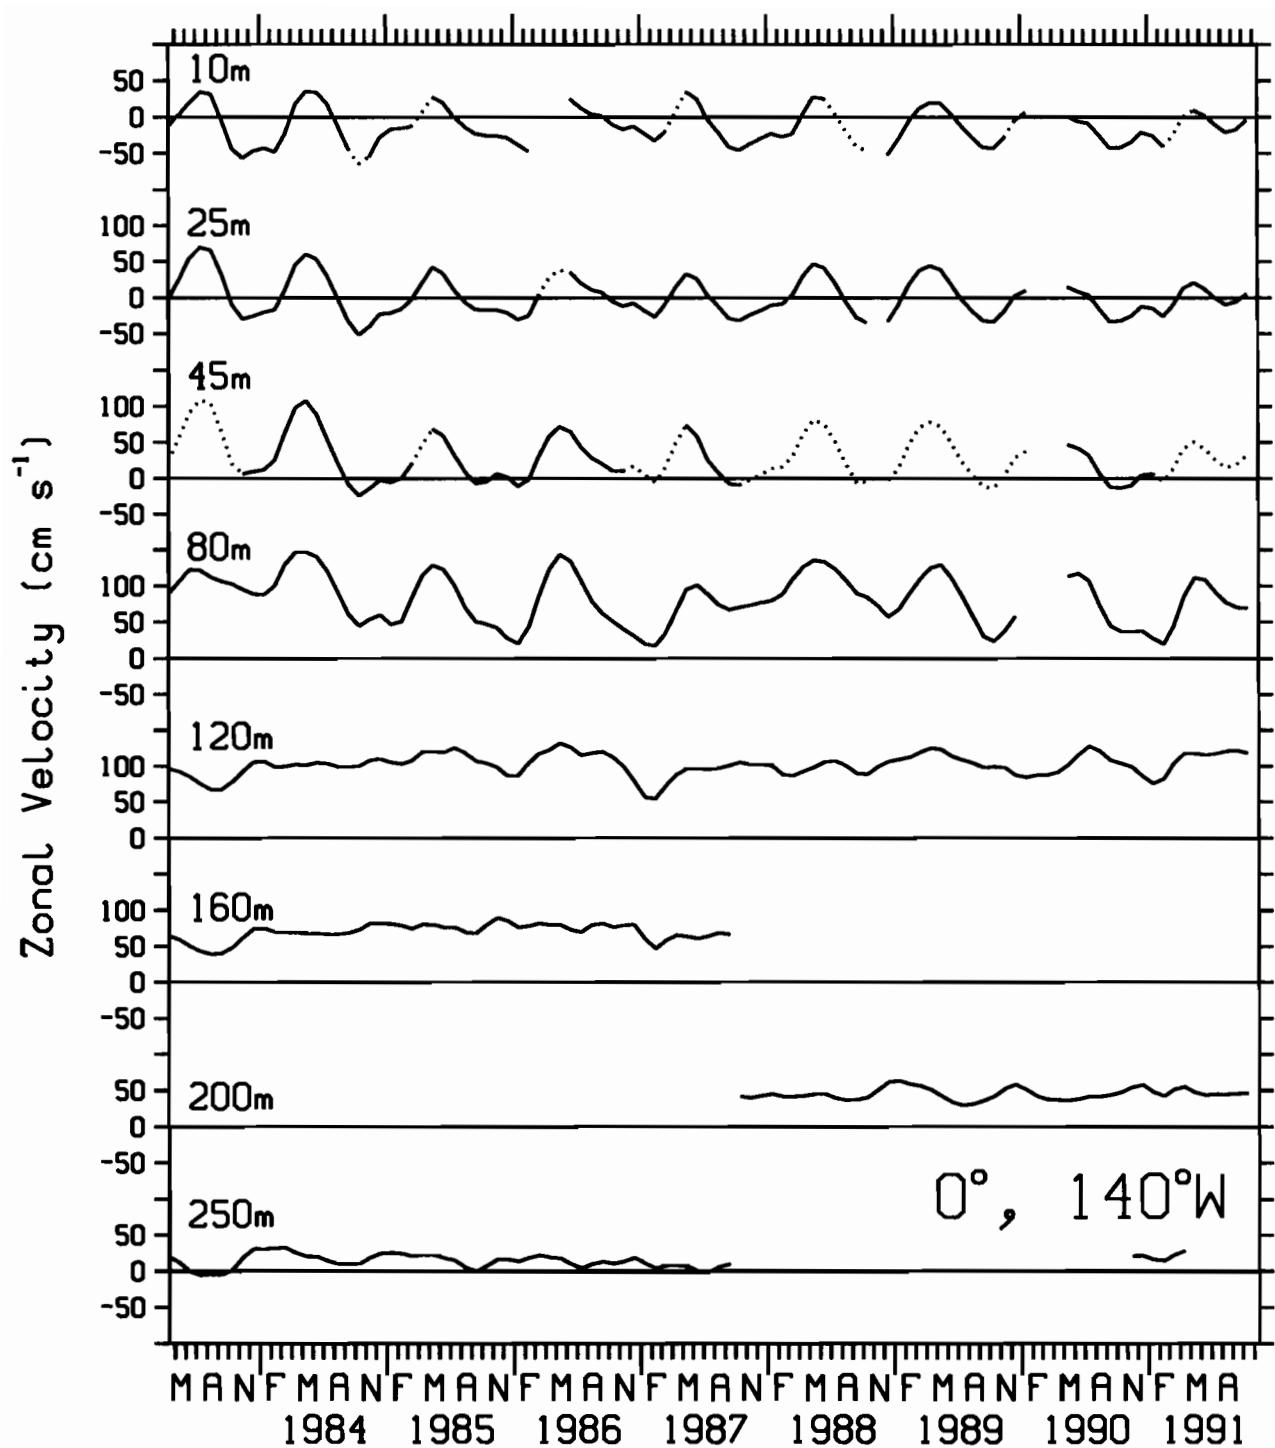

Figure B3. Time series of monthly mean zonal velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ$ ,  $140^\circ\text{W}$ . Dotted lines indicate data that have been filled by vertical interpolation or extrapolation.

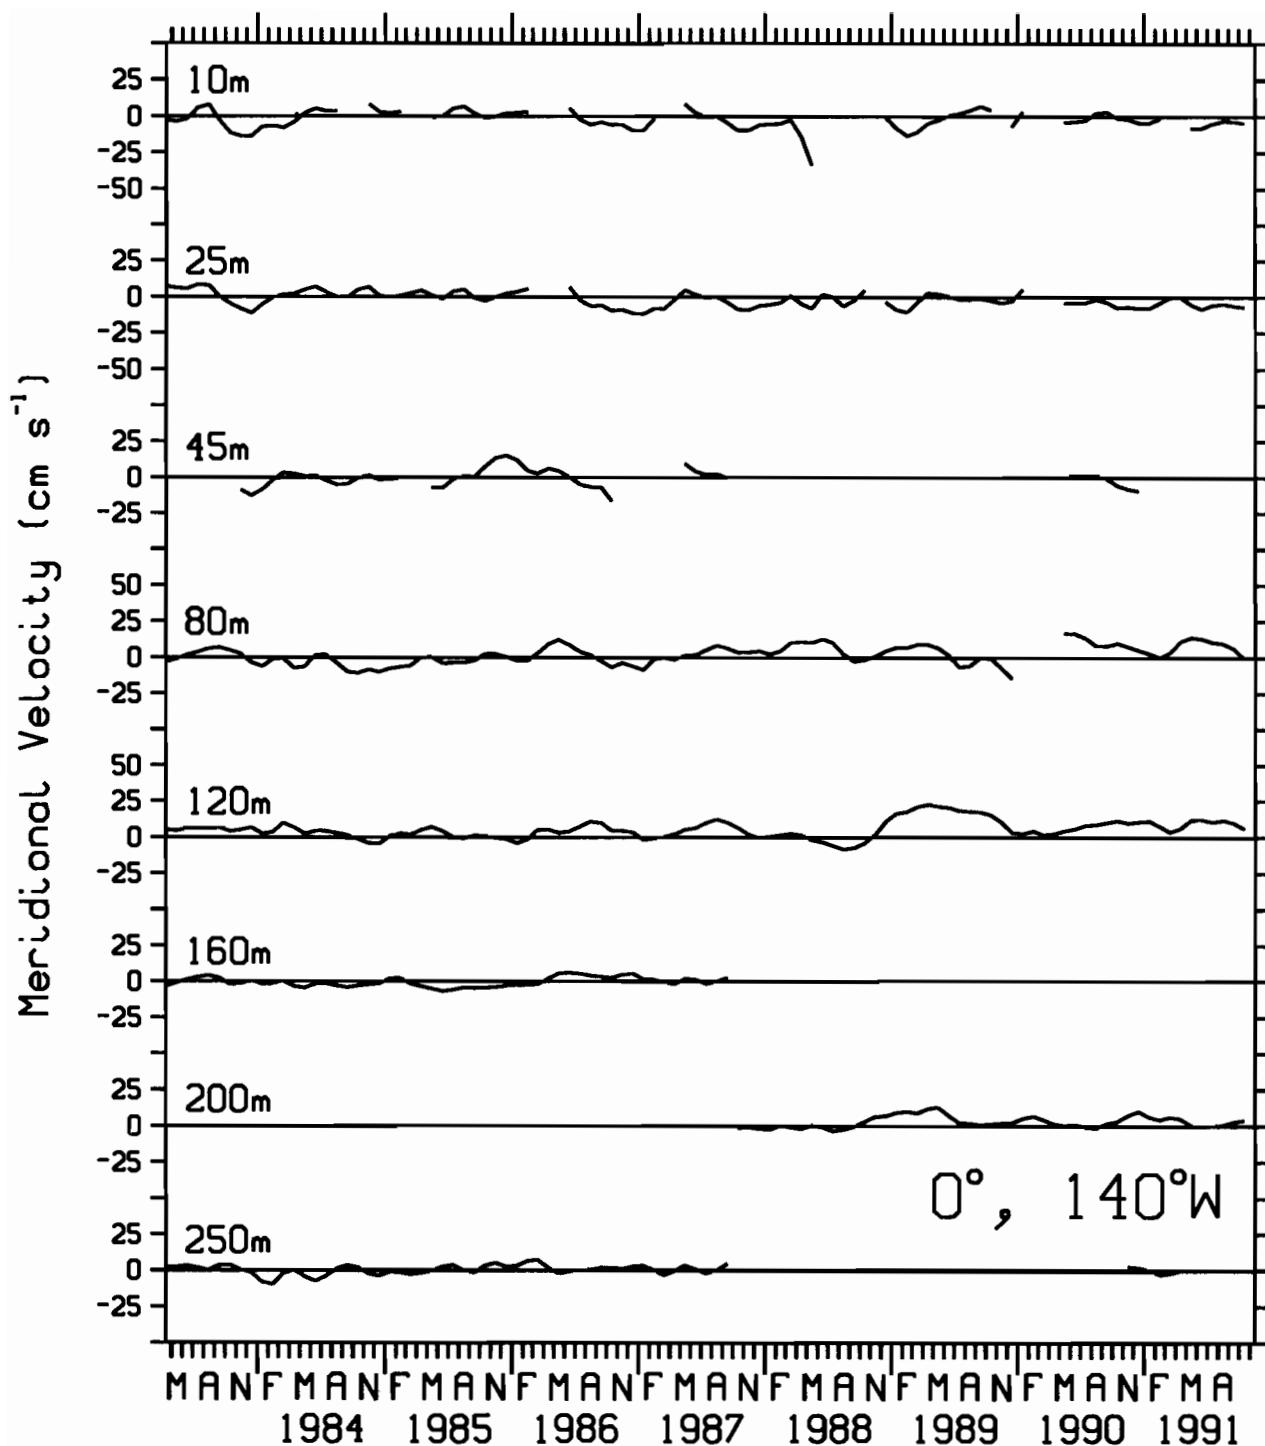

Figure B4. Time series of monthly mean meridional velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ, 140^\circ\text{W}$ .

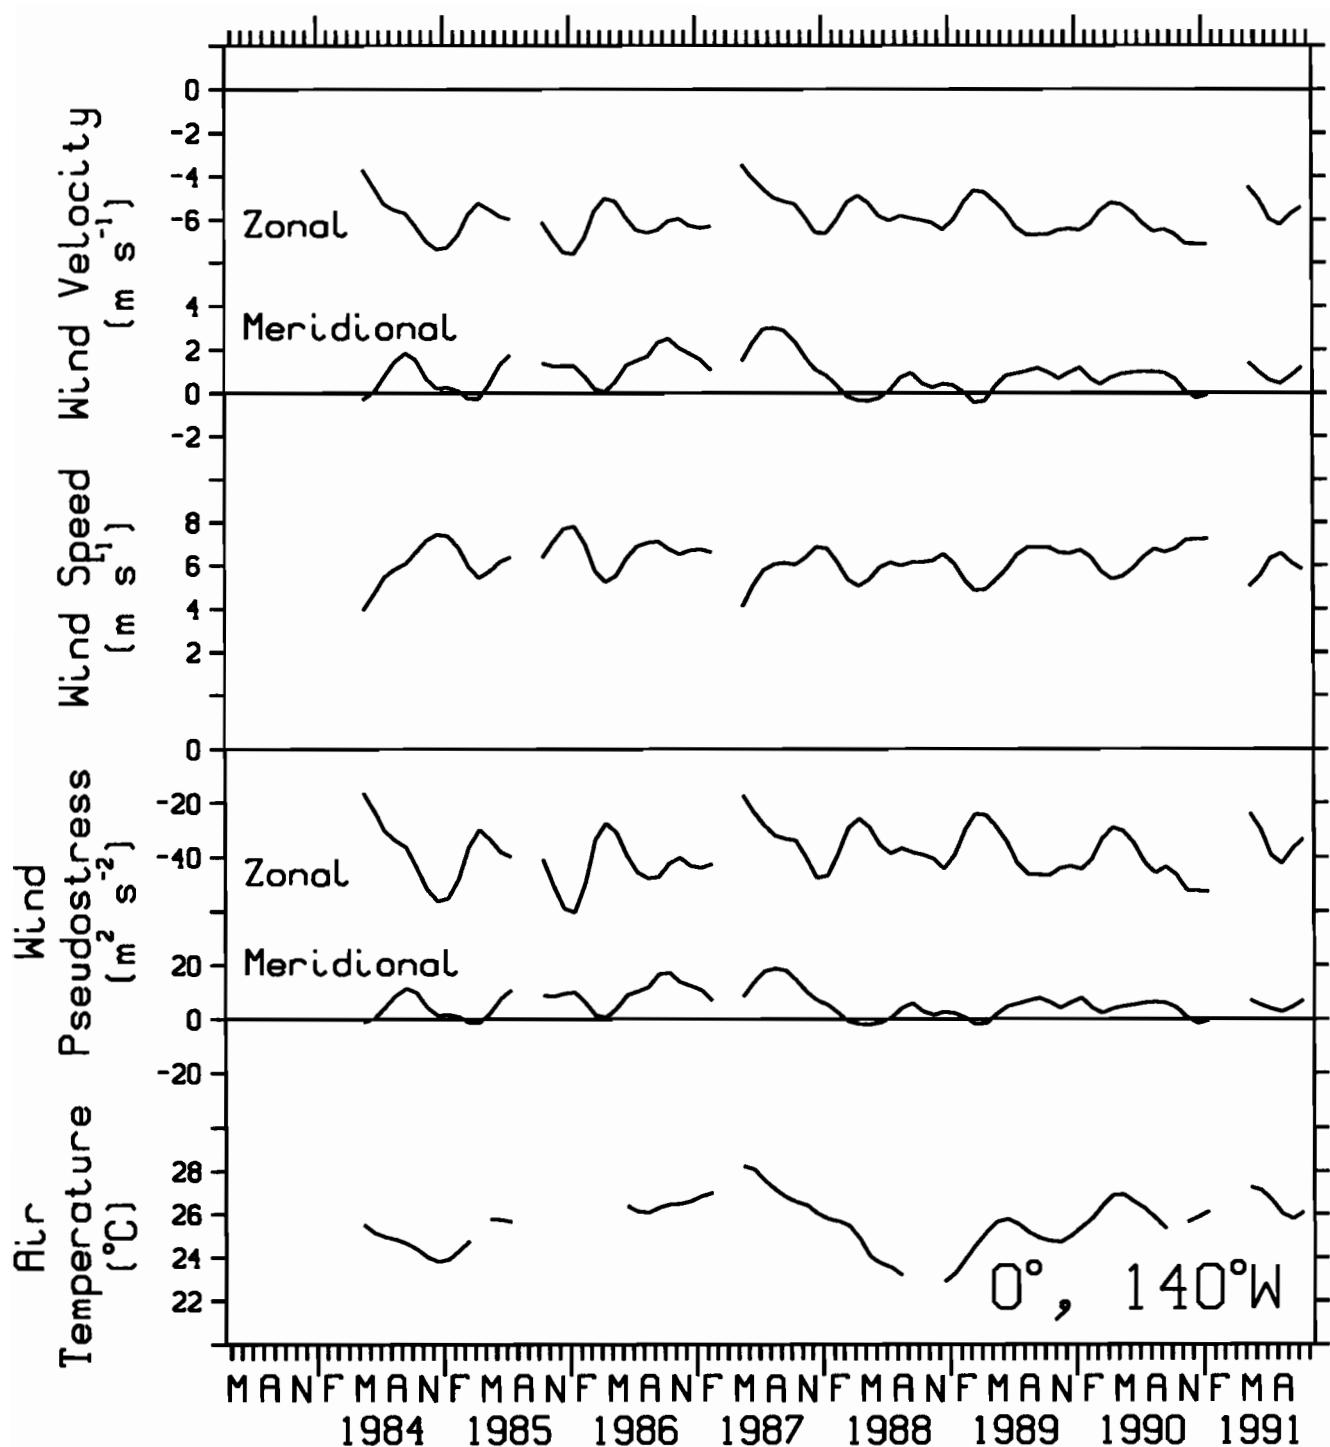

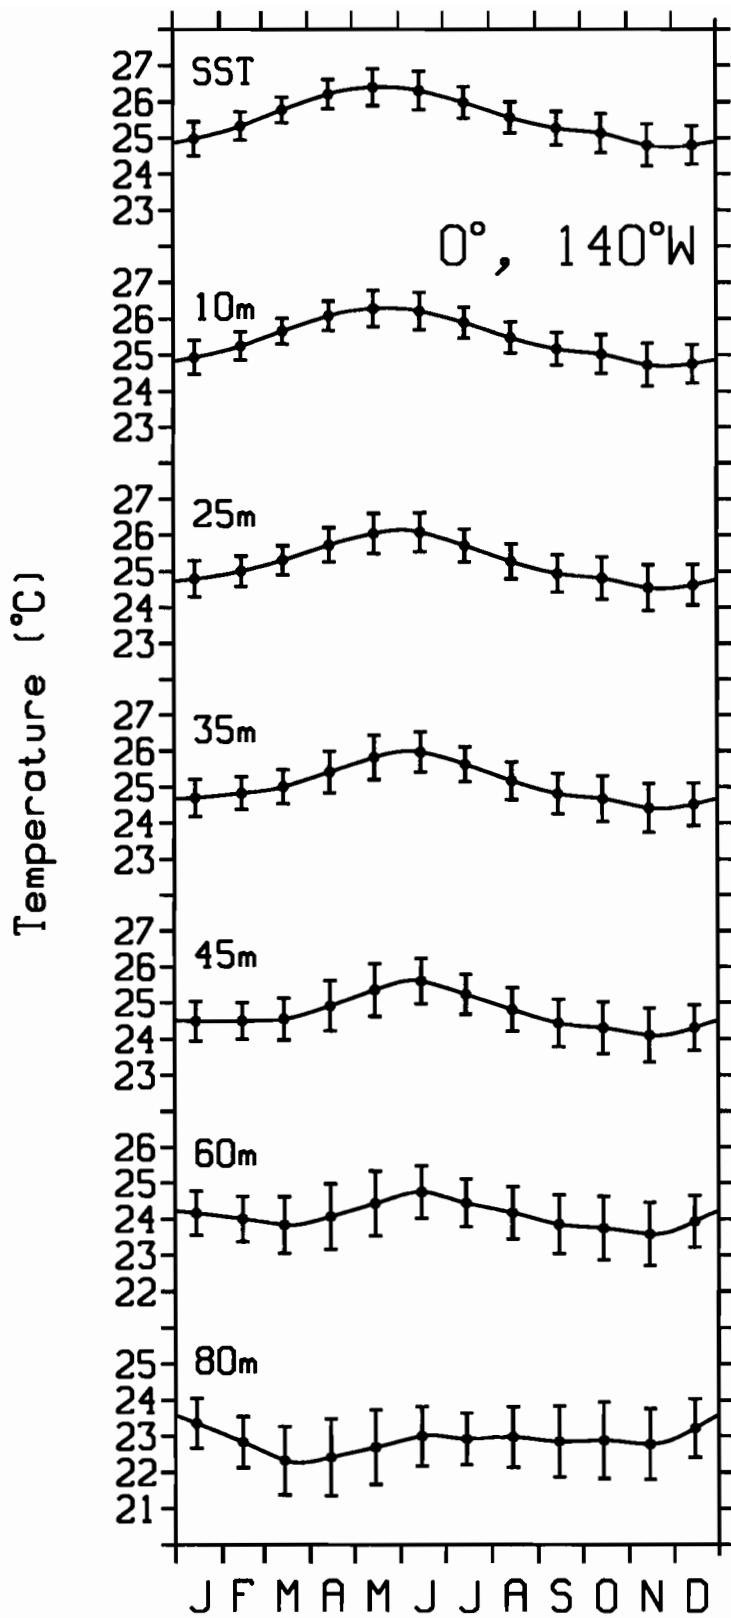

Figure B5. Time series of monthly mean winds and air temperatures at  $0^{\circ}$ ,  $140^{\circ}\text{W}$ .

**Figure B6.** Time series of climatological monthly mean temperatures (in  $^{\circ}\text{C}$ ) at  $0^{\circ}$ ,  $140^{\circ}\text{W}$ . One standard error is shown for means based on more than 3 estimates.

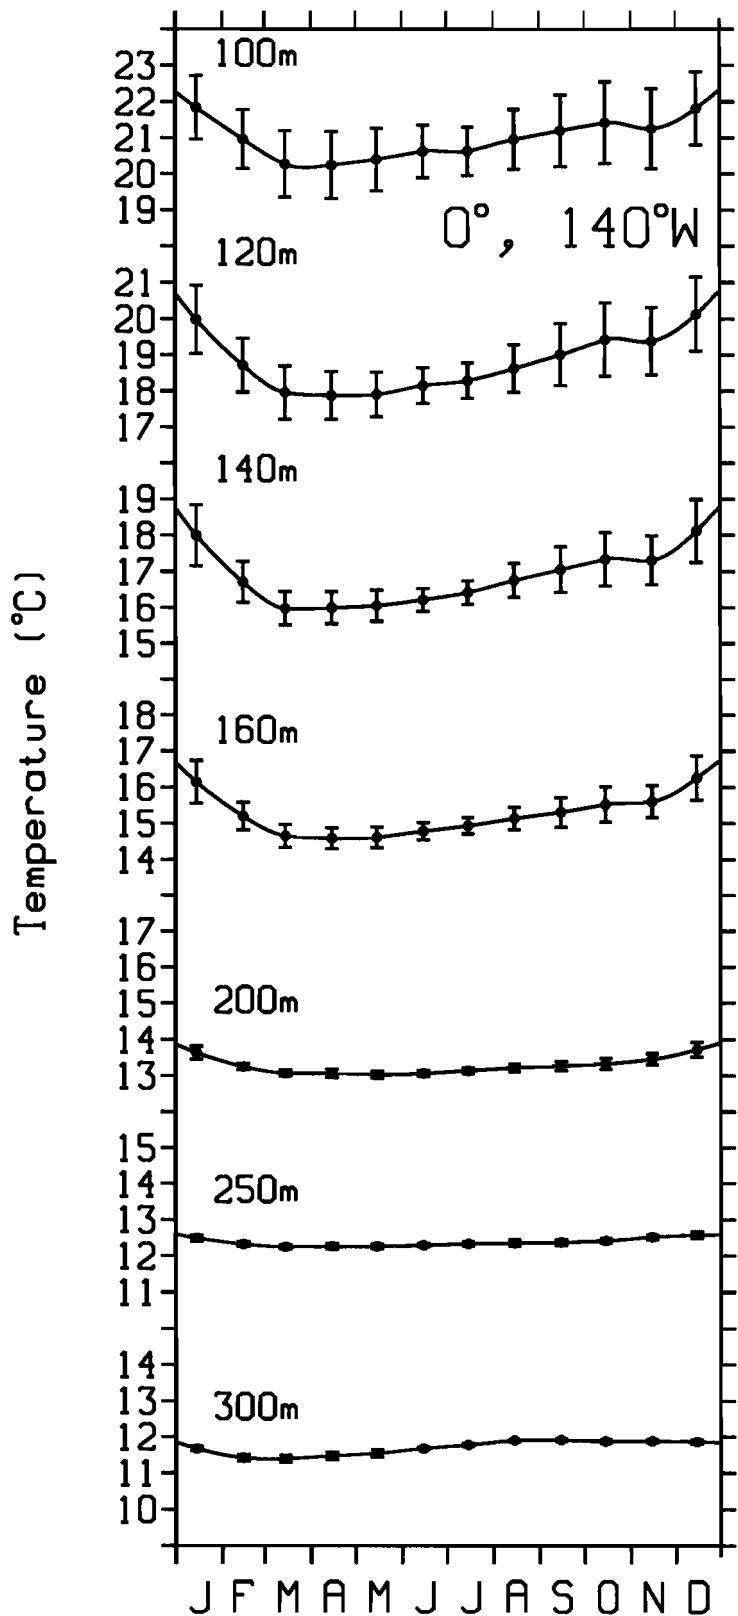

Figure B6. Continued.

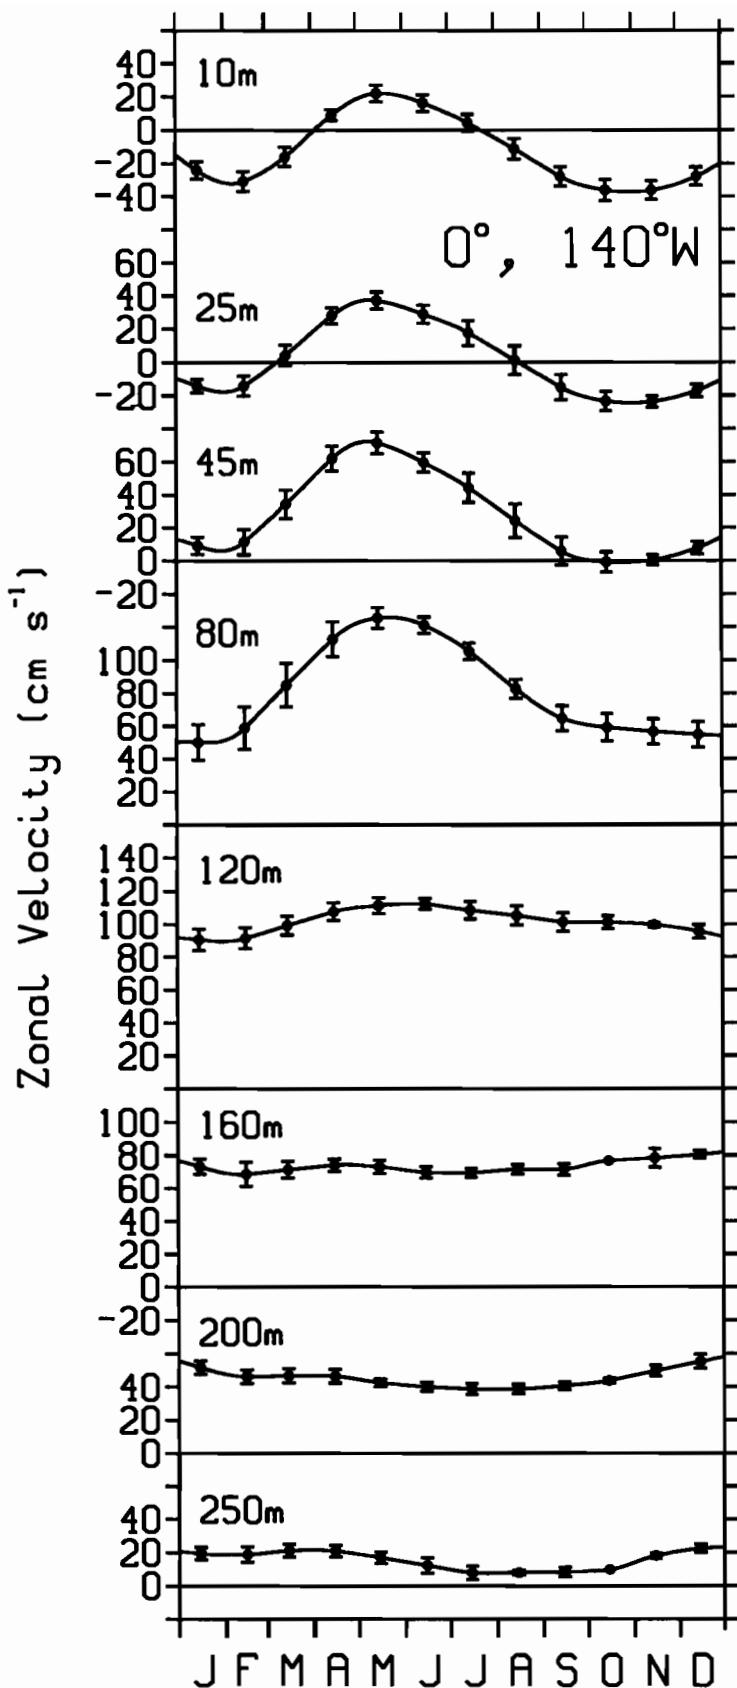

Figure B7. Time series of climatological monthly mean zonal velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ$ ,  $140^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

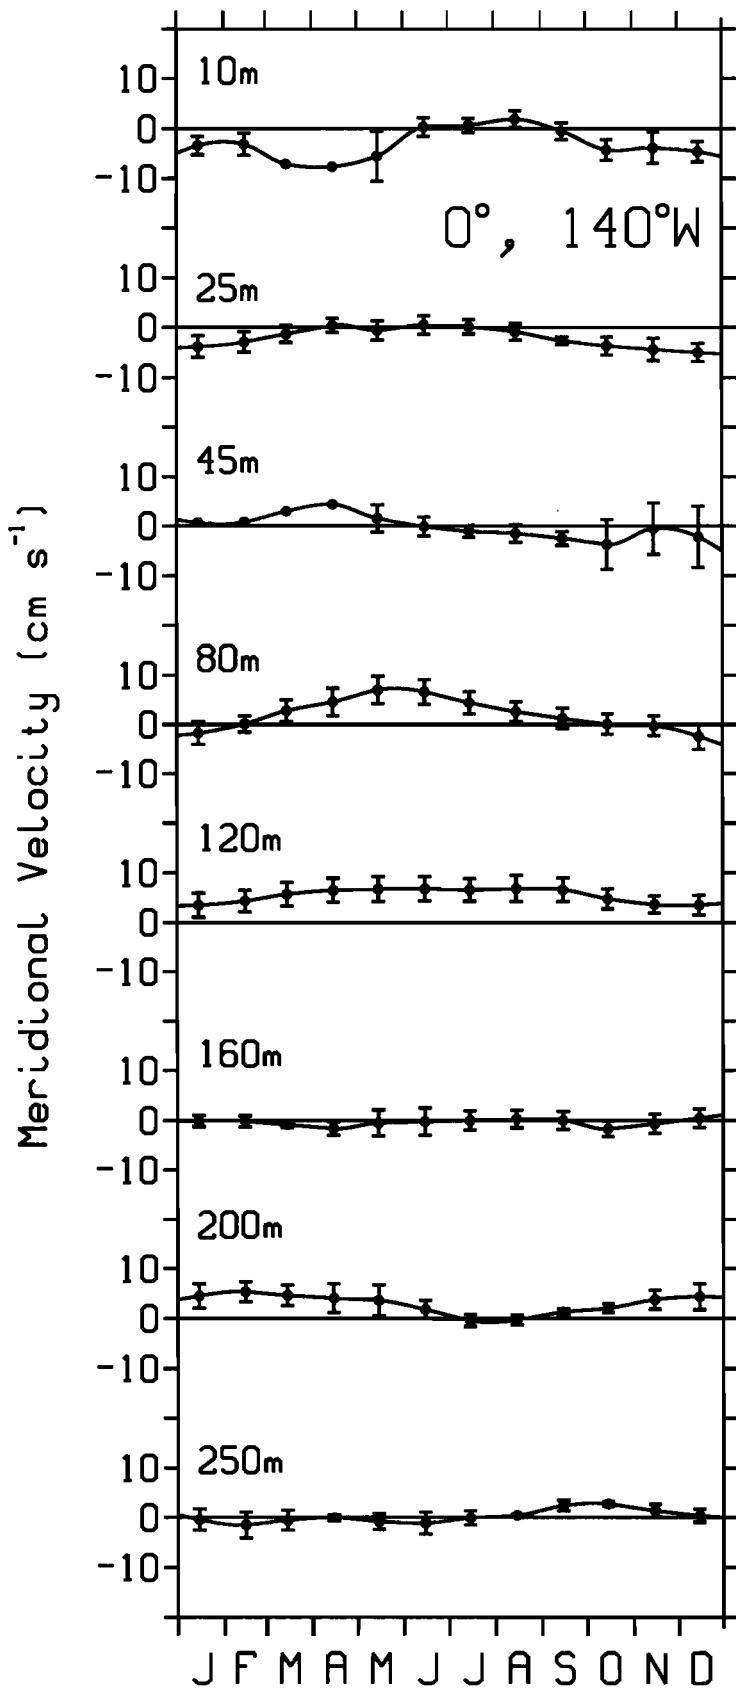

Figure B8. Time series of climatological monthly mean meridional velocities (in  $\text{cm s}^{-1}$ ) at  $0^\circ$ ,  $140^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

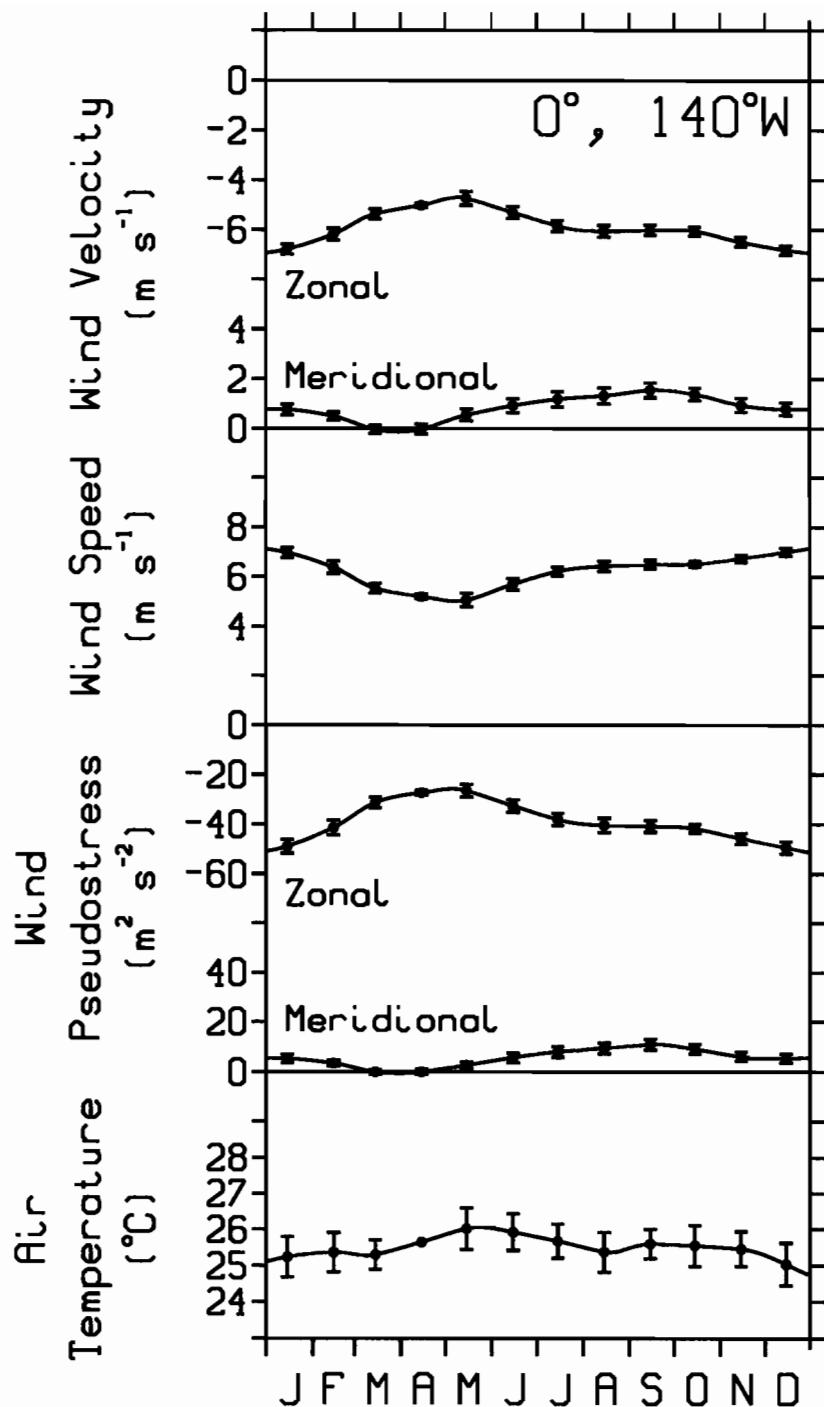

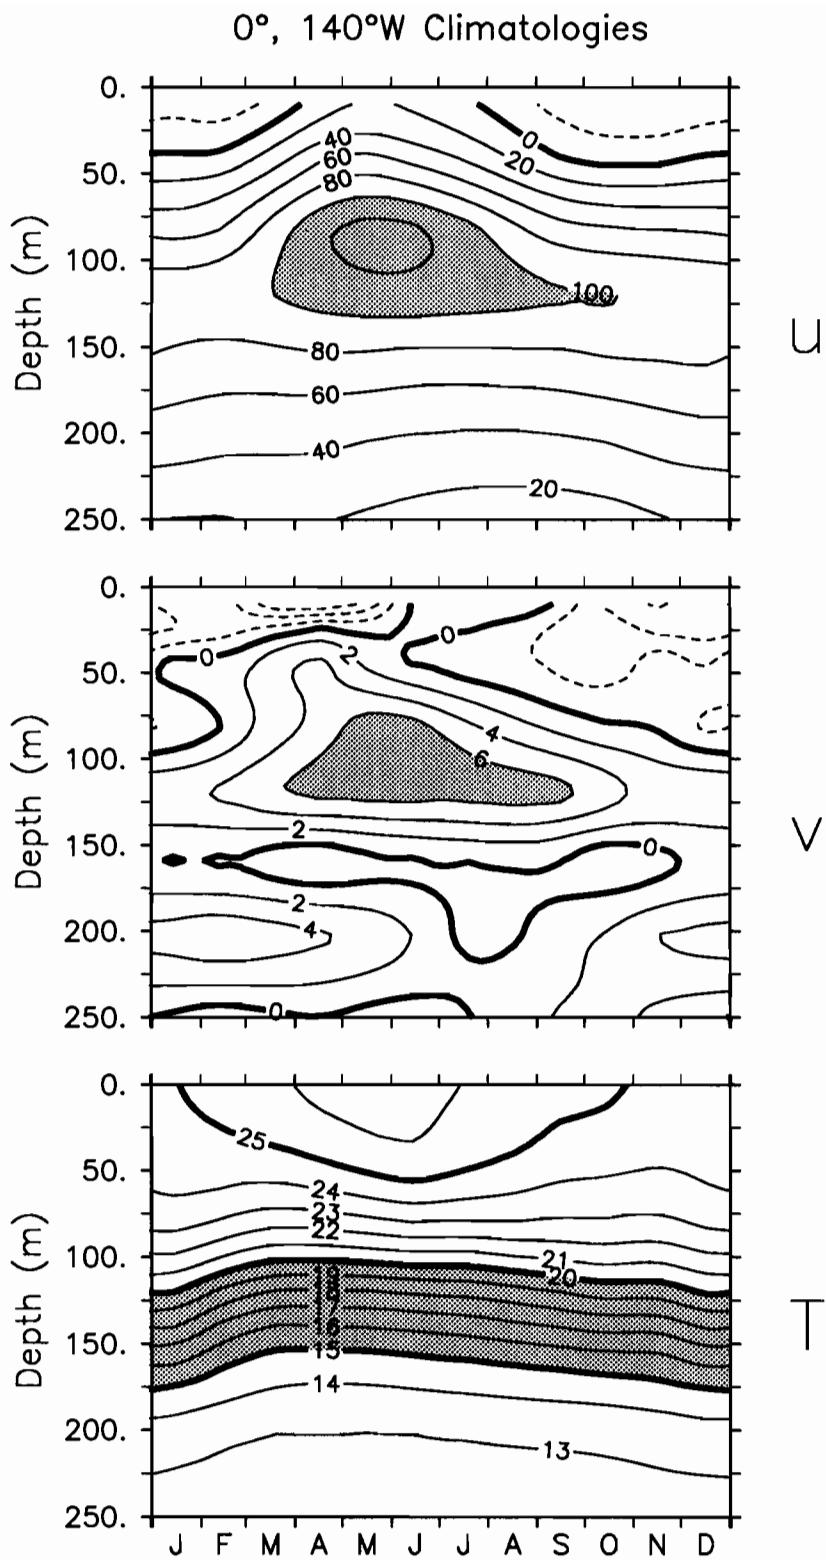

Figure B9. Time series of climatological monthly mean winds and air temperatures at  $0^\circ, 140^\circ\text{W}$ . One standard error is shown for means based on more than 3 estimates.

**Figure B10.** Contoured time series of zonal velocity (u), meridional velocity (v) and temperature (T) at 0°, 140°W. Velocities are in  $\text{cm s}^{-1}$  and temperature is in  $^{\circ}\text{C}$ . Dashed contours are for westward or southward flow. Shading highlights zonal velocities  $> 100 \text{ cm s}^{-1}$ , meridional velocities  $> 6 \text{ cm s}^{-1}$  and temperatures between 15°–20°C.

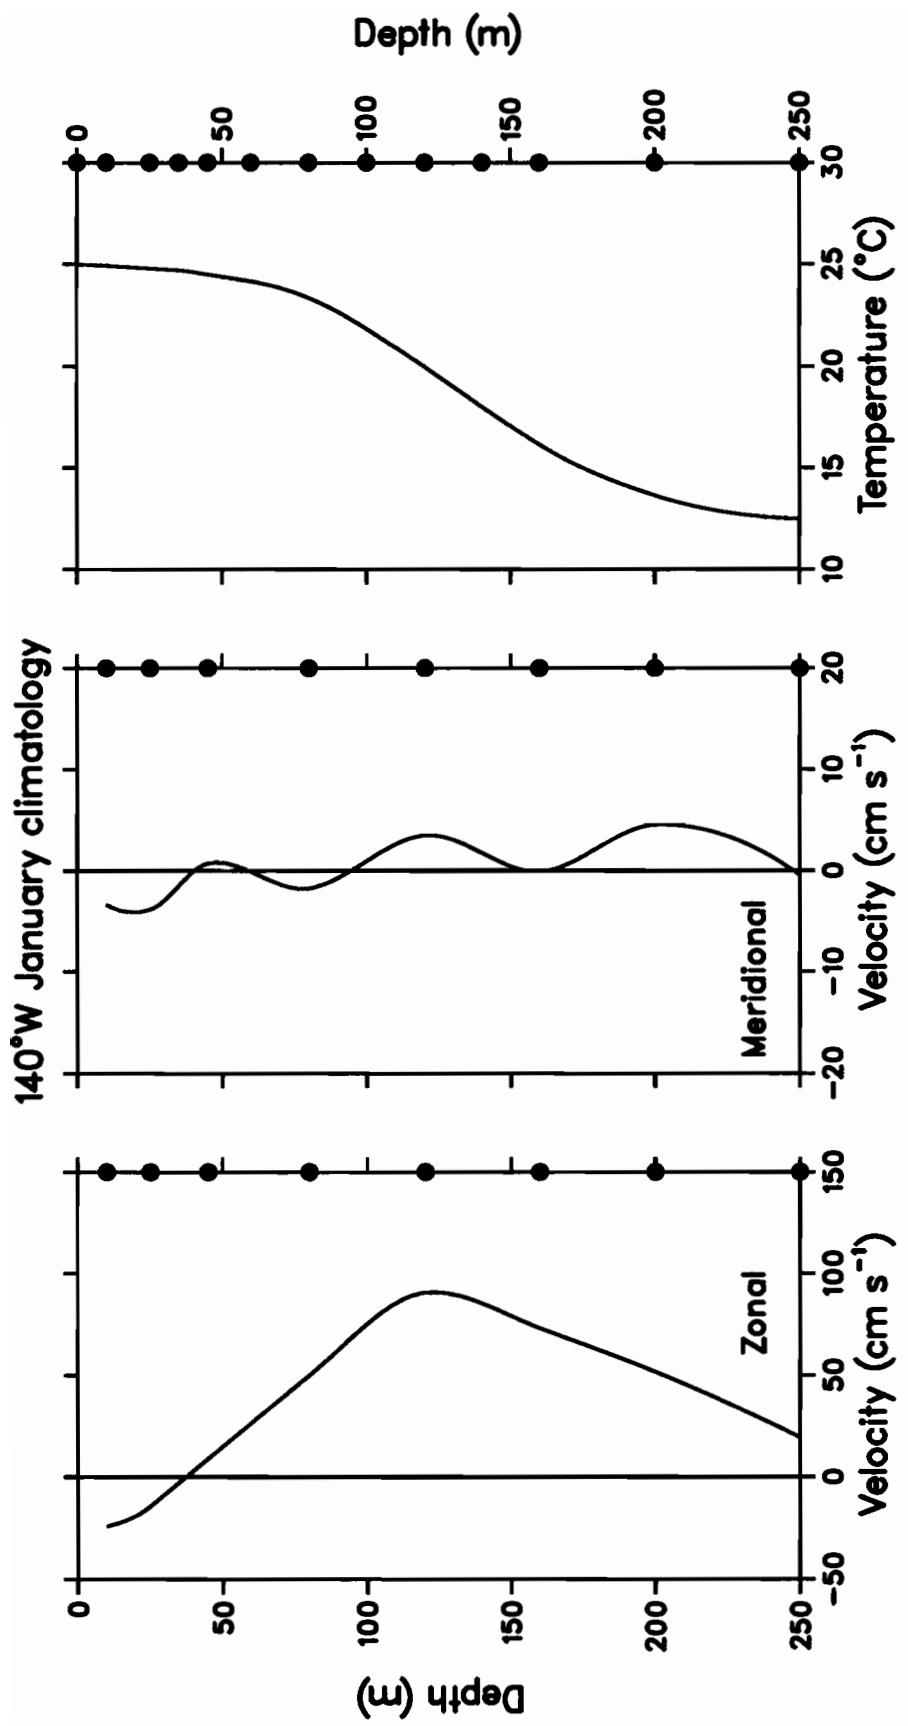

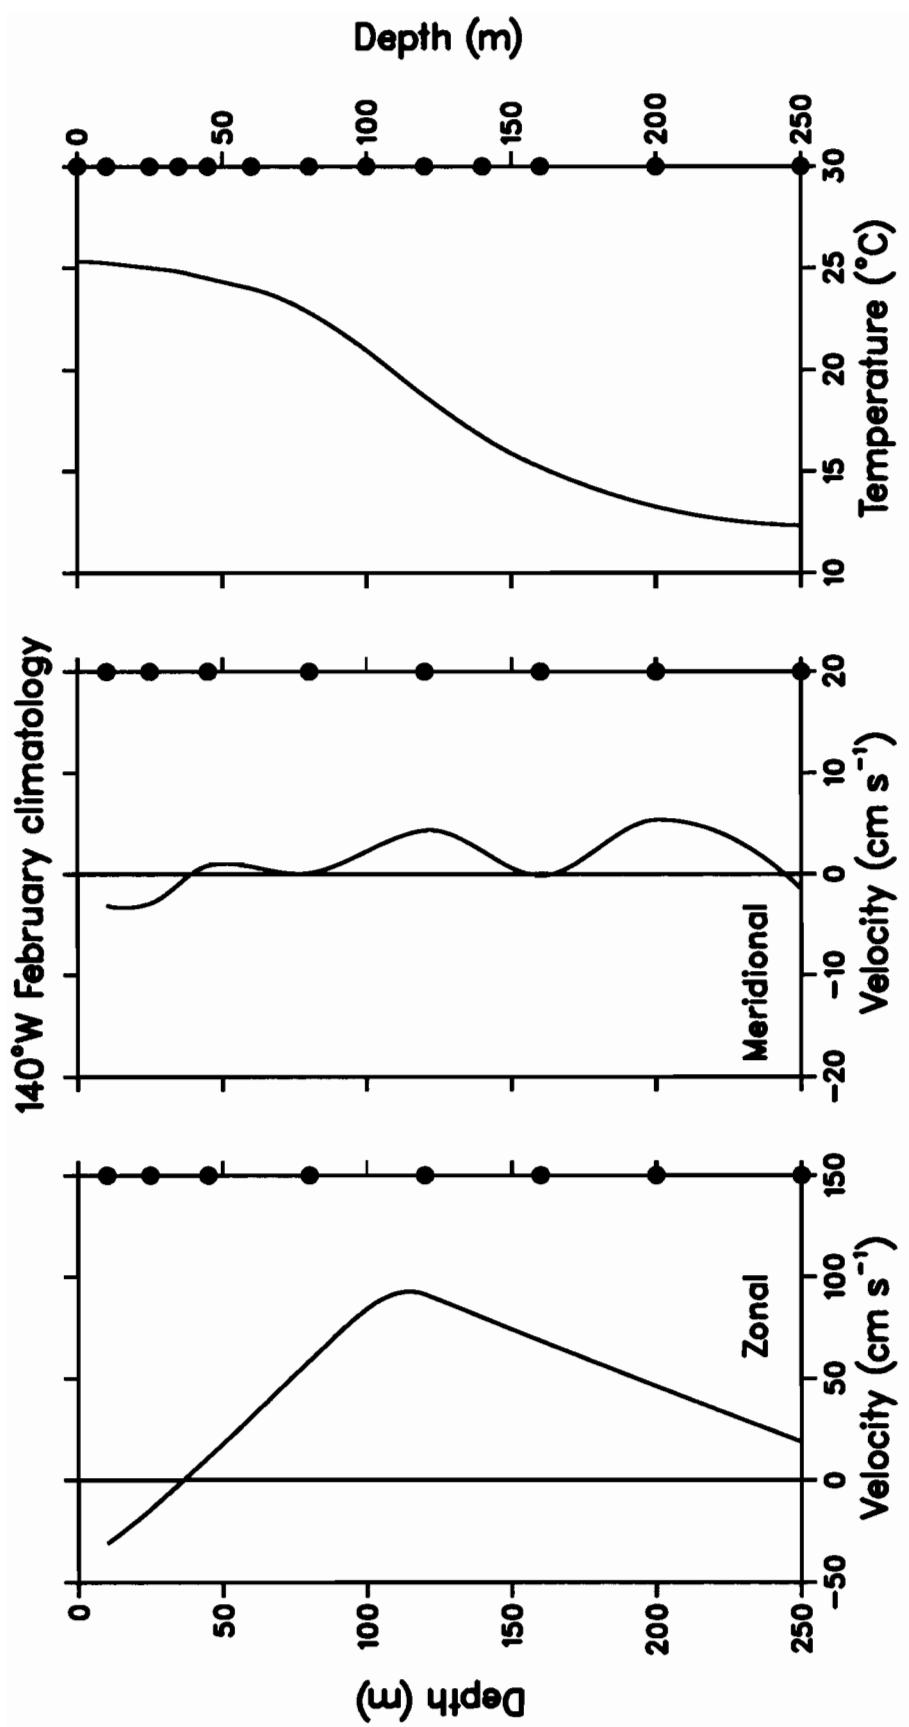

Figure B11. Climatological monthly mean profiles of zonal velocity, meridional velocity and temperature at  $0^{\circ}$ ,  $140^{\circ}\text{W}$ . Solid circles on the left axes indicate standard depths on which the profiles are based.

**Figure B11.** Continued.

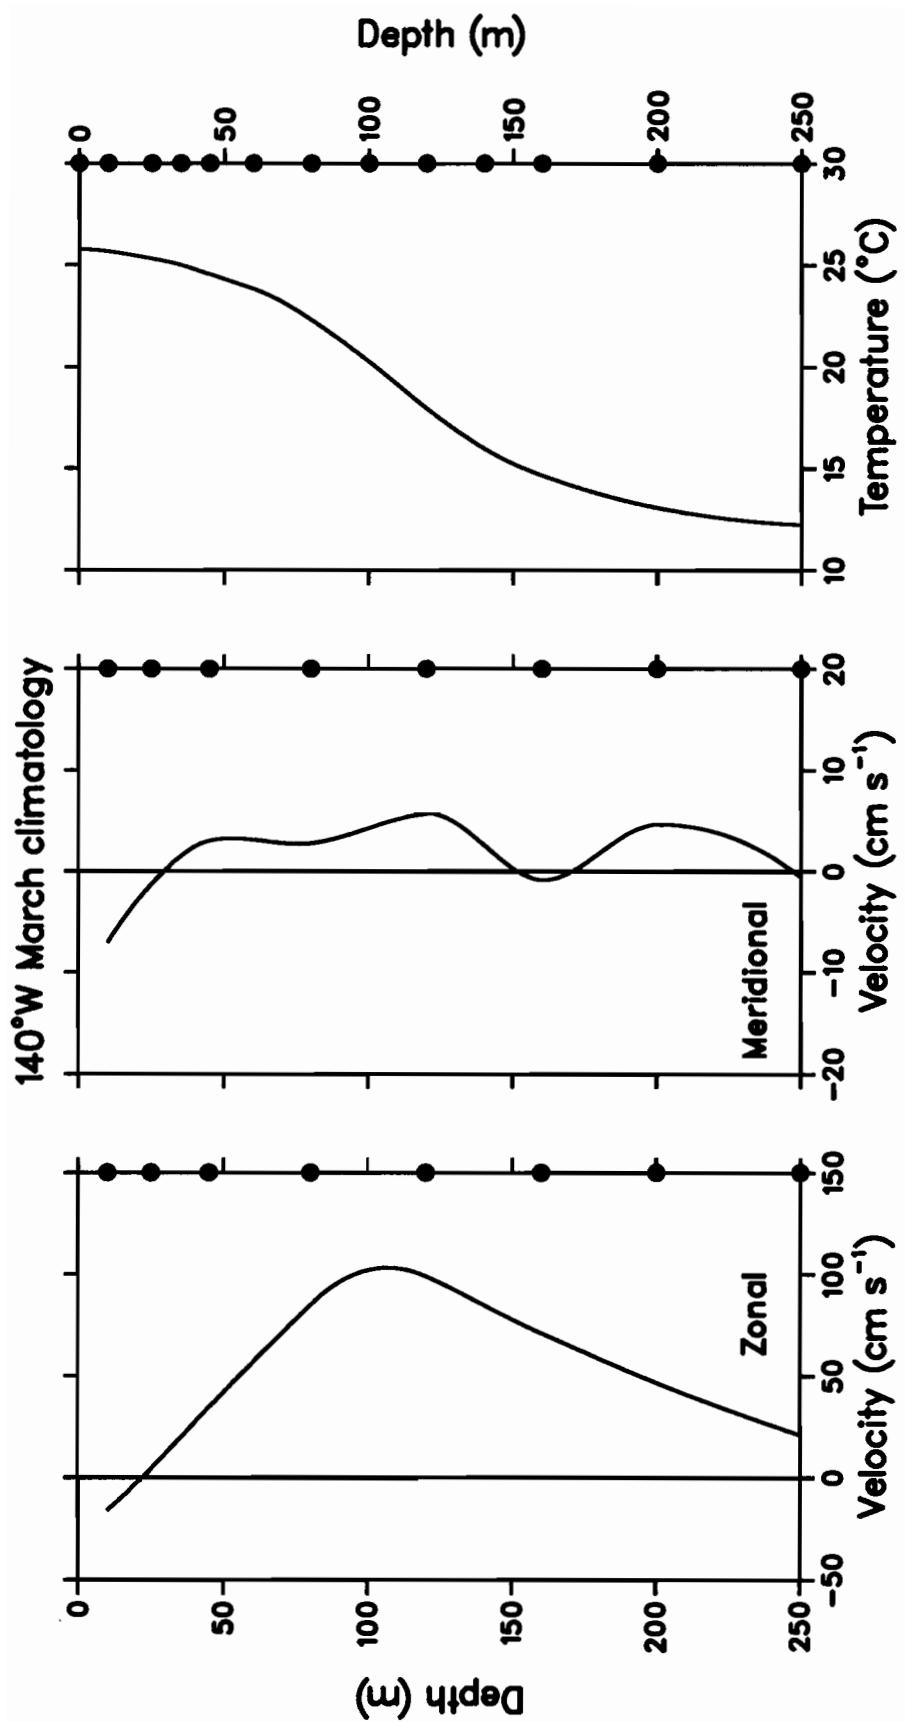

Figure B11. Continued.

**Table B6.** Mean seasonal cycles of zonal velocity (in  $\text{cm s}^{-1}$ ) between the surface and 250 m at  $0^\circ$ ,  $140^\circ\text{W}$ . Statistics are based on N monthly estimates, M of which are directly measured.

Table B10. Annual means for winds and air temperatures at 0°, 140°W. Statistics are based on N = 12 climatological monthly means as presented in Table B8. NTOT is an index showing the total number of months of directly measured data at each depth.

	Air Temperature (degrees C)						N	NTOT
	Mean	Std. Dev.	Skew	Min	Max			
Air T	25.51	0.28	0.21	25.04	26.02	12	70	
	Winds (m/s)						N	NTOT
	Mean	Std. Dev.	Skew	Min	Max			
Zonal	-5.90	0.67	0.22	-6.82	-4.74	12	83	
Meridional	0.81	0.52	-0.34	-0.05	1.54	12	83	
Speed	6.18	0.66	-0.43	5.06	7.00	12	83	
	Wind Pseudo-stress (m**2/s**2)						N	NTOT
	Mean	Std. Dev.	Skew	Min	Max			
Zonal	-38.75	7.73	0.21	-49.42	-26.61	12	83	
Meridional	5.41	3.57	-0.15	-0.15	10.93	12	83
